## Executive summary

**NOTE:** A list of all abbreviations and key definitions are available in Appendix 1.

**Objectives:** To identify what is known about public health surveillance programs, systems, indicators, and strategies for monitoring the indirect population health impact attributable to the COVID-19 pandemic and associated public health response measures for governments globally.

**Design:** Rapid scoping review

**Method:** A search was conducted in MEDLINE/PubMed, EMBASE, BIREME-LILACS, WHO-PAHO IRIS and other institutional repositories from 2020 and forward. Study selection was performed by single-reviewer titles/abstracts and full text screening. Data extraction was performed with a single abstraction approach. Results are presented following the framework proposed by the World Health Organization in "[Strengthening population health surveillance: a tool for selecting indicators to signal and monitor the wider effects of the COVID-19 pandemic](#)".

**Results:** 23 reports and 59 studies were found. Among the documents, six documents were related to surveillance systems and ten addressed frameworks. Important measures for monitoring the population health impact attributable to either the COVID-19 pandemic or the associated public health response include measuring the capacity and quality of health services through indicator areas such as supply of, and demand for, essential medicines, PPE, other critical medical equipment (ventilators, dialysis materials), and diagnostic tests. Affected routine health care, staff shortages, supply shortages and partial or complete closure of some health facilities should be measured as they represent indirect effects of the COVID-19 outbreak. Containment measures had impacted other sectors of wellbeing, with some of the most significant negative consequences observed in employment and income loss, unpaid labor, education, food security, and personal safety, affecting mostly women. Risk factors and wider determinants of health such as income, education, transport behavior, and access to essential services are indicators of the indirect effects of containment measures. Other direct and indirect impacts of the pandemic affect mental health, well-being, quality of life, sleep patterns, morbidity and mortality.

**Conclusion:** Evidence was not available to support all of the indicator areas stated by the WHO document individually. Most of the mechanisms were found, however, there was no explanation for some indicators included in the following pathways: fear of getting infected or spreading infection, impaired healthcare for non-COVID-19 conditions and direct effects of containment measures, and for some health outcomes. Most of the information was concentrated on the pathways related to access, indirect effects by risk factors, wider determinants of health and health outcomes. New areas of indicators were identified and fitted into the pathways established.

## Introduction

On March 11, 2020, the World Health Organization (WHO) announced that COVID-19, a predominantly respiratory illness caused by a novel coronavirus, was a pandemic (1). Since then, there has been a substantial impact on human health and the economy globally (2).

Beyond the morbidity and mortality directly associated with COVID-19 (i.e., among individuals infected with SARS-CoV-2), the pandemic has also indirectly impacted society more broadly. These indirect effects are a result of the public health measures implemented worldwide to contain the spread of COVID-19, such as stay-at-home orders, business closures, and travel restrictions; as well as indirect impact on health care services, such as closures, staffing shortages, and reduced quality of care. These indirect effects impact the general population, not just those who have become ill with COVID-19. For the purposes of this report, healthy people who have not been infected with the SARS-CoV-2 virus, are defined as the "general population", including several vulnerable groups such as women, children, older people, prisoners, migrants, and people experiencing homelessness. The WHO recommends monitoring these populations closely because they are more likely to be negatively impacted by the COVID-19 pandemic, including the indirect effects (3).

Although some indicators have been identified to monitor the indirect effects of the pandemic, a systematic review of the published evidence will aid to identify possible systems, surveillance techniques or tools that could expand and complement existing methodologies.

Therefore, this report aims to answer the following research question: What is known about public health surveillance programs, systems and strategies for monitoring the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures for governments globally? The following sub-questions were also considered:

- Are there other published **frameworks for integrating indicators across multiple domains** that are different from the one described by WHO in "Strengthening population health surveillance: a tool for selecting indicators to signal and monitor the wider effects of the COVID-19 pandemic"?
- Are there other **surveillance indicators** that are different from the ones considered by WHO in "Strengthening population health surveillance: a tool for selecting indicators to signal and monitor the wider effects of the COVID-19 pandemic"?

Mapping this information will strengthen the concepts previously provided in the WHO framework report.

## Methods

This rapid scoping review was conducted according to the World Health Organization guide for rapid reviews, the JBI 2020 guidance on scoping reviews (4), and reported according to the PRISMA-ScR statement (5).

**Table 1. Eligibility criteria**

Population/Problem	General population
<b>Concepts of interest</b>	<ul style="list-style-type: none"> <li>• Published frameworks, public health surveillance programs, systems and strategies that contain and integrate indicators to monitor the health effects that are indirectly attributable to the COVID-19 pandemic.</li> <li>• Published frameworks, public health surveillance programs, systems and strategies that contain and integrate indicators to monitor the health effects that are directly or indirectly attributable to the associated public health response to the pandemic.</li> <li>• Indicators to monitor the health effects that are directly attributable to the COVID-19 pandemic, contained in frameworks, public health surveillance programs, systems and strategies.</li> <li>• Indicators to monitor the health effects that are directly or indirectly attributable to the associated public health response to the pandemic, contained in frameworks, public health surveillance programs, systems and strategies.</li> </ul>
<b>Outcome</b>	<ul style="list-style-type: none"> <li>• Health effects that are directly attributable to the COVID-19 pandemic (e.g., psychological effects)</li> <li>• Health effects that are directly or indirectly attributable to the associated public health response to the pandemic (e.g., lockdown, healthcare impact, changes in risk factors, SES indicators, socioeconomic aspects).</li> </ul>
<b>Setting</b>	CSAR is leading PHAC efforts to identify indicators for health impacts, to ultimately develop an indicator framework for reporting on the wider impacts of COVID-19. To inform this work, CSAR has requested an evidence review of what existing surveillance systems/programs could be utilized to inform key indicators – and to provide data with which to assess the wider effects of the pandemic (for example, info on discrimination, changes in health care service utilization, unemployment etc.)

## Literature Search

We searched evidence syntheses, including systematic reviews, scoping reviews, and rapid syntheses (from now on ‘systematic reviews’), guidelines, primary studies and organizational reports. An experienced librarian developed and tested the search strategies through an iterative process in consultation with the review team. Each database was searched using an individualized search

strategy; to review the complete strategies, see **Appendix 2**. The databases consulted were MEDLINE/PubMed, EMBASE, BIREME-LILACS, WHO-PAHO IRIS and other institutional repositories (OECD Library, CEPAL, UN Library, World Bank Library, National Academies of Sciences, Engineering, and Medicine). Searches were conducted from 2020 forward.

### **Study Selection**

Study selection was performed by single-reviewer titles/abstracts screening and single-reviewer full text screening (PV, LM). The online platform 'Covidence' (Covidence systematic review software, Veritas Health Innovation, Melbourne, Australia. Available at [www.covidence.org](http://www.covidence.org)) was used for titles/abstracts and full-text screening steps. Training was provided to all reviewers at the beginning of the review and during the review for consistency purposes.

### **Data Extraction**

The data extraction from the evidence was carried out in a Google Form developed. The form was tested independently on three articles by two researchers (PVS, LM) and iteratively improved after discussion.

- For each evidence synthesis included, we documented the following information: title, author, focus, publishing year, date of the last literature search, country, population, concepts, outcomes, and key findings.
- For primary studies, we documented the following information: title, authors, publishing date, type of design, focus, population, concepts, outcomes, and key findings.
- For official policy/government documents and documents that provide recommendations: title, country, authors/organization, publishing date, focus, target population, concepts, and key findings.

After checking that the Google Form was exhaustive, training of reviewers was performed. We used a single abstraction approach (PVS, LM).

### **Data Synthesis**

Data was synthesized narratively and descriptively. The main results of the studies included upon full-text screening are summarized in tables (text) following the framework proposed by the WHO in "Strengthening population health surveillance: a tool for selecting indicators to signal and monitor the wider effects of the COVID-19 pandemic" (3), after discussion by the research team.

The document mentioned above describes the following as pathways (**bold**) and the areas of indicators that are included in each of them.

**Fear of Getting infected or spreading infection:** psychological distress, health literacy, discrimination, poisoning incidents, antibiotics prescription and consumption patterns, emergence and spread of drug-resistant pathogens; **2. Impaired health care for non-COVID-19 conditions: access:**

SPOR Evidence Alliance

**UNED**

unmet health care needs, waiting times, coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions), patient-Reported Experience Measures (PREMs), human resources for health/workload, COVID-19 infections and quarantines among health care staff, stress/well-being among health care staff, telemedicine consults, supply of and demand for (essential) medicines, supply of and demand for PPE, supply of and demand for other critical medical equipment (ventilators, dialysis materials); **3. Impaired health care for non-COVID-19 conditions: quality:** health care quality in various settings (for example, primary care, hospital care, acute care), patient safety /adverse effects, the average length of stay in hospital for (specific) non-COVID-19 conditions, patient-Reported Experience Measures (PREMs), adherence to medical guidelines, timeliness of quality control measures; **4. Impaired health care for non-COVID-19 conditions: financial protection:** public spending on health (by function, provision, illness), public spending on social services, Out-of-pocket payments, catastrophic and impoverishing health spending, unmet needs; **5. Direct effects of containment measures:** Household size, Loneliness, Work-life balance, Time spent on unpaid domestic and care work, Time spent outside / time for leisure activities, Psychological distress, Home working conditions, Interpersonal violence (intimate partner violence, child maltreatment, elderly abuse), (Unmet) need for informal care, Social support, Adherence to containment measures such as hygiene and physical distancing measures; **6. Indirect effects of containment measures through risk factors:** Tobacco use, Alcohol use, Physical activity, Overweight/obesity, Hypertension, High cholesterol, Diet, and Illicit drug use, **7. Indirect effects of containment measures through wider determinants of health:** Income / (at risk of) poverty, Public spending on essential services, Unemployment, Workers on flexible contracts / informal workers, Education, Childhood development, Air quality, Transport behavior; **8. Health outcomes:** General health and well-being: Self-perceived (mental) health, Quality of life, Well-being, Sleep, Patient-Reported Outcome Measures (PROMs); Morbidity: Occurrence of chronic diseases, Occurrence of mental disorders, Occurrence of (vaccine-preventable) infectious diseases, Occurrence of non-fatal injuries; Mortality: All-cause mortality, Excess mortality, Mortality from chronic diseases, Mortality from infectious diseases other than COVID-19, Fatal injuries (including suicide), Maternal mortality, Neonatal mortality, Under-five mortality, and Avoidable mortality.

## **Results presentation**

We present the results in two sections. First, we present a summary of the Key Findings of the literature, and second, we present tables that summarize the mechanisms and indicators founded based on the Conceptual framework of the main pathways for the wider effects of the COVID-19 pandemic presented in the WHO framework (3).

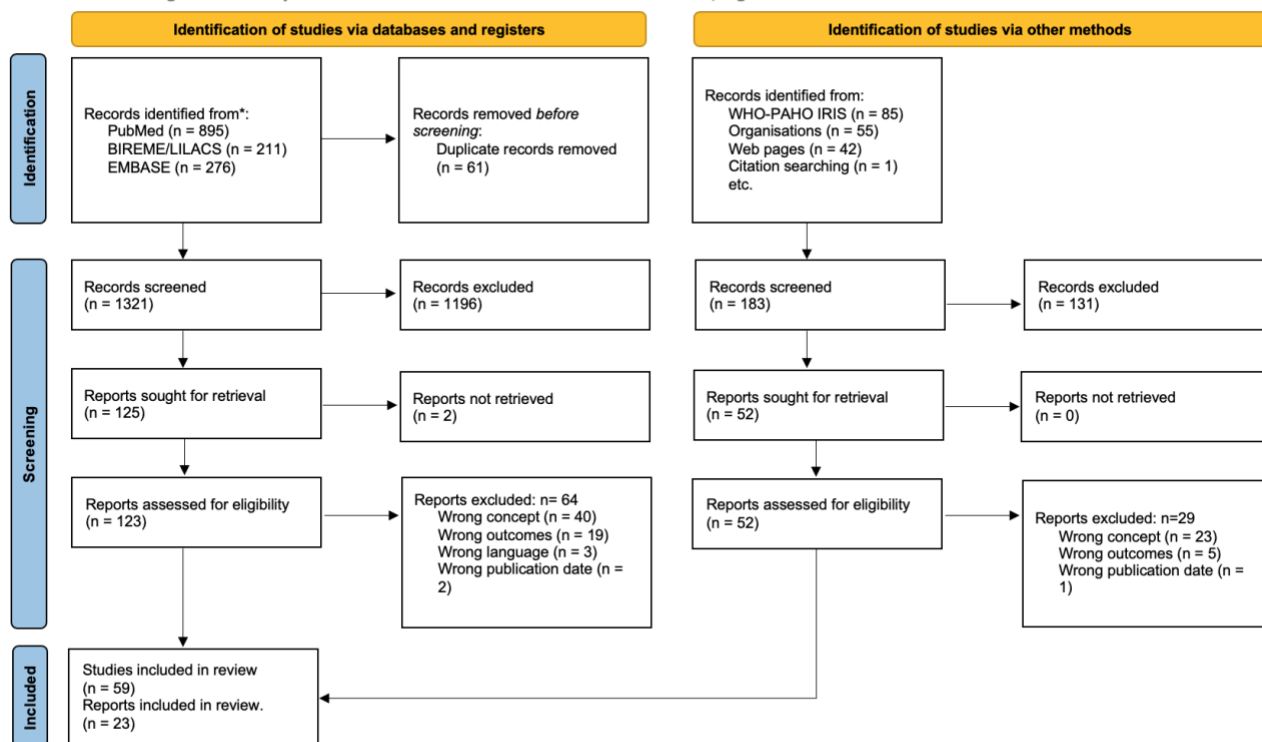

## Results

### Selection process

The search identified 1,382 potential references. After titles and abstracts screening, 123 articles were assessed for eligibility in full text, 64 records were excluded during this process, and the reasons for their exclusion are presented in the PRISMA diagram (**Figure 1**). Subsequently, we included 59 articles and 23 reports that were identified via other methods.

**Figure 1. Modified PRISMA flow diagram.**

PRISMA 2020 flow diagram for new systematic reviews which included searches of databases, registers and other sources

From: Page MJ, McKenzie JE, Bossuyt PM, Boutron I, Hoffmann TC, Mulrow CD, et al. The PRISMA 2020 statement: an updated guideline for reporting systematic reviews. *BMJ* 2021;372:n71. doi: 10.1136/bmj.n71. For more information, visit: <http://www.prisma-statement.org/>

### Key findings

The most important findings from the studies are presented in **Table 2** and **Table 3**, separated by the pathways proposed in the World Health Organization document “Strengthening population health surveillance: a tool for selecting indicators to signal and monitor the wider effects of the COVID-19 pandemic” (3).

The search found 15 systematic reviews (6–20), one scoping review (21), two guidelines (22,23), eight non-systematic reviews (24–31), 38 primary studies (32–69) and 18 organization reports (70–87).

**Appendix 3** presents in detail the evidence retrieved from all the included studies, along with the citations and link to the articles.

From the main findings we retrieve information related to indicators, area of indicators and underlying mechanisms.

### Underlying mechanisms

No underlying mechanisms were found for the following areas: health literacy, discrimination, poisoning incidents, timeliness of quality control measures, home working conditions, (unmet) need for informal care, general health and well-being (well-being), morbidity(occurrence of non-fatal injuries), and mortality(all-cause mortality, neonatal mortality and under-five mortality). **Table 2** presents the mechanisms by which each indicator area is affected.

### Areas of indicators

The graphical representation of the main pathways and indicator areas found in this review is presented in **Figure 2**. Each color represents a pathway, and its indicator areas are weighted according to the amount of information supporting it.

For the pathway, “Fear of getting infected or spreading infection” the “Psychological distress” indicator area was the most frequent.

The impaired healthcare for non-COVID-19 conditions pathway is divided into three main categories: Access, quality and financial protection. The “Access” pathway was mostly represented by the “Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)” area, followed by “Human resources for health/workload”, and the less represented indicator areas were “Prescription patterns/trends” and “Waiting times”. For the financial protection category, the “Public spending on health (by function, provision, illness)”; and for the quality domain, the “Health care quality in various settings (for example, primary care, hospital care, acute care)” were the indicator areas mostly found.

Regarding the “Direct effects of containment measures” pathway, the indicator area, “Psychological distress” was identified as the main category, whereas “Physical activity” and “Unemployment” represented the majority for “Indirect effects of containment measures through risk factors” and “Indirect effects of containment measures through wider determinants of health” respectively. The occurrence of chronic diseases and self-perceived (mental) health were the most represented indicator areas for the “health outcomes” category.

**Table 3** presents the indicator areas, with the indicators metadata and composition, the recommended disaggregation, information sources and frequency of measuring (when reported). For the pathway “fear of getting infected or spreading infections”, no indicators were found for the following areas: poisoning incidents, health literacy and discrimination.

For the “impaired health care for non-COVID-19 conditions - access” pathway, we identified new areas for indicators not identified within the WHO document such as the supply of and demand for surgery, supply of and demand for diagnostic tests, and supply of and demand for other medical equipment. No information was found for the indicator area “COVID-19 infections and quarantines among health care staff”.

Regarding the pathway “impaired health care for non-COVID-19 conditions - financial protection”, funding and allocation of resources, personal spending and purchasing and payment systems were identified as new areas of indicators. No information was found for unmet needs and catastrophic and impoverishing health spending areas. For the impaired health care for non-COVID-19 conditions - quality pathway, no information was found for timeliness of quality control measures.

According to the literature, for the “direct effects of containment measures” pathway, no information was found related to the following areas; home working conditions, unmet need for informal care, and household size.

New areas were found for the “Indirect effects of containment measures through risk factors” and “Indirect effects of containment measures through wider determinants of health” pathways, namely other substances use, and access to financial institutions/government financial support.

In this review, information for the following “health outcomes” was not found; neonatal mortality, and under-five mortality.

### Surveillance programs, systems and strategies

Six documents that address surveillance systems were found, **table 4** presents the detailed description. The included surveillance systems monitored different indicators of interest, including health outcomes (30); impact of COVID-19 on healthcare utilization using a range of syndromic indicators (36); major behavioral and intermediate chronic disease risk factors (39); COVID-19 pandemic impact on health access and outcomes for sexual or gender minority (SGM) individuals (65); risk of major depressive disorders and anxiety during the COVID-19 pandemic (66); and sentinel and non-sentinel epidemiological and virological surveillance for influenza, SARS-CoV-2, and potentially other respiratory viruses (76).

### Published frameworks.

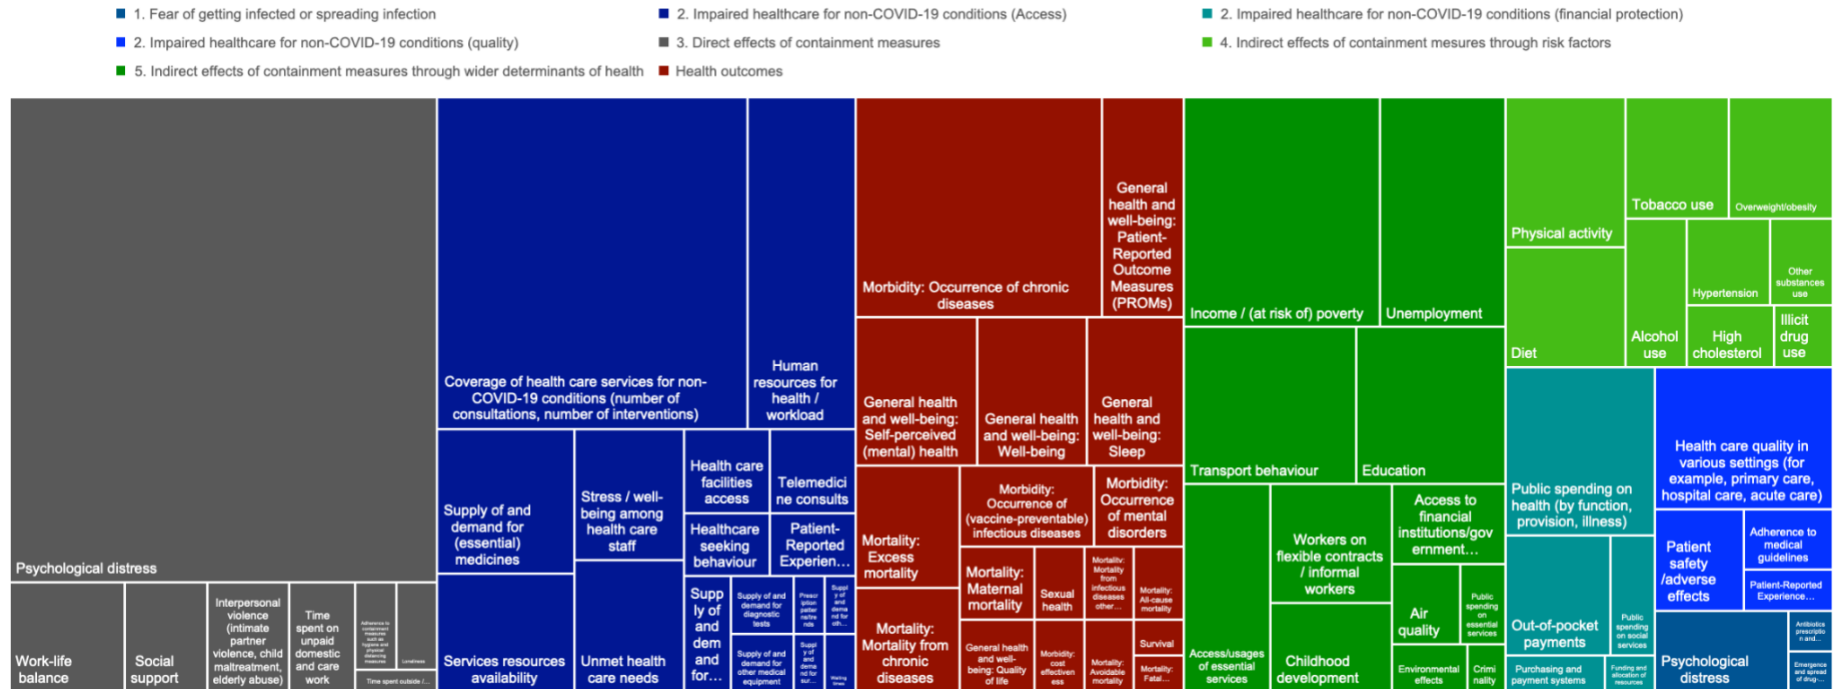

Ten documents that present or use different frameworks were found. From those, seven integrated different indicator areas (**Figure 3**). Those documents included three studies that reported their findings according to the existing frameworks: the Global Monitoring Framework for non-communicable diseases (25), the WHO Health Systems Framework (28), and the socioecological framework (27). One document that presented a new framework: Monitoring and evaluation framework for COVID-19 response activities in the EU/EEA and the UK (70), a five-step framework proposed to support decision-making (88), a proposed framework aimed to assess the performance and progress of the country and

regional responses against the country's national plans/responses, and the WHO COVID-19 Strategic Preparedness and Response Plan (84), and one document that provides technical specifications for each indicator included in the menu of indicators proposed for primary health care (PHC) measurement framework and indicators (83).

The remaining three documents include a study that developed a cost-effectiveness framework to evaluate societal costs and quality adjusted life years (QALYs) lost due to six health-related indirect effects of COVID-19 in California (35), an article that describes how following the National Academies of Sciences, Engineering, and Medicine proposal of a uniform national framework for data collection recommendations could help improve the quality and timeliness of public health surveillance data during pandemics (42), and a study that develops a Culturally Responsive Trauma-Informed Public Health Emergency Framework for Aboriginal and Torres Strait Islander Communities in Australia (67).

The main characteristics of the frameworks are presented in **Table 5**.

**Figure 2. Treemap representing the pathways and indicator areas weighted according to the amount of information supporting them. Each color represents a pathway and its indicator areas.**

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

Figure 3. Integrated indicator areas across published frameworks

PHC measurement framework				Monitoring and evaluation framework for COVID-19 response activities				Global Monitoring Framework for NCDs				Developed decision-making framework				
Health facility density/distribution (including primary care)	Human resources for health / workload	Health care quality in various settings (for example, primary care, hospital care, acute care)		Adherence to medical guidelines		Health care services	Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)	Loneliness	Social support	Alcohol use	Tobacco use	Hypertension	Income / (at risk of) poverty	Workers on flexible contracts / informal workers	Safety nets	Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)
Supply of and demand for (essential) medicines	Other medical devices	Patient-Reported Experience Measures (PREMs)		Patient safety /adverse effects						Supply of and demand for PPE						
Supply of and demand for diagnostic tests	Telemedicine consults	Public spending on health (by function, provision, illness)	Funding and allocation of resources	Purchasing and payment systems	Transport behavior	Work behavior	Adherence to medical guidelines	Mortality: Excess mortality	Diet		Overweight/obesity	High cholesterol	Proposed framework to assess the...		WHO Health...	The...
Patient-Reported Experience Measures (PREMs)	Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)								Adherence to containment measures such as hygiene and physical distancing measures				Accessibility, affordability, acceptability	Education	Health care quality in various settings (for example, primary care, hospital care, acute care)	Morbidity: Occurrence of (vaccine-preventable) infectious diseases
												Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)	Diet		General health and well-being: Well-being	

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

## Conclusions

- Most of the underlying mechanisms were found, however, for the areas of health literacy, discrimination, poisoning incidents, timeliness of quality control measures, home working conditions, (unmet) need for informal care, general health and well-being, occurrence of non-fatal injuries, all-cause mortality, neonatal mortality and under-five mortality, no information was identified within the literature.
- For the “fear of getting infected or spreading infections” pathway, indicators such as health literacy, discrimination, and poisoning incidents were not found in the literature.
- The new areas detected for the “impaired health care for non-COVID-19 conditions - access” were the supply of and demand for surgery, supply of and demand for diagnostic tests, and supply of and demand for other medical equipment. No information was found for “COVID-19 infections and quarantines among health care staff”.
- Regarding the pathway “impaired health care for non-COVID-19 conditions - financial protection”, Funding and allocation of resources, personal spending and purchasing and payment systems were identified as new areas of indicators. No information was found for unmet needs and catastrophic and impoverishing health spending.
- For the “impaired health care for non-COVID-19 conditions – quality” pathway, no information was found for timeliness of quality control measures.
- For the “direct effects of containment measures”, no information was related to the following areas; home working conditions, unmet need for informal care, and for household size.
- Two new areas were found for the “Indirect effects of containment measures through risk factors” and “Indirect effects of containment measures through wider determinants of health”, such as other substances use and access to financial institutions/government financial support, respectively.
- In this review, information for the following “health outcomes” was not found: neonatal mortality, under-five mortality.
- It was found in the evidence that the COVID-19 outbreak has directly affected the population through concerns regarding COVID-19 contraction, the uncertainty over employment and financial hardships, fear of the unknown, and social isolation as a result of pandemic measures. Those findings were classified in the literature in the fear of getting infected or spreading infection’s pathway.
- The Indirect effects of the COVID-19 outbreak related to the “impaired access to health care for non-COVID-19 conditions” were due to several healthcare programs disruptions (whether their preventive or curative health services routines), staff shortage due to the reassignment of healthcare workers, stock-out of vaccines and other supplies, the need to postpone health programs, and partial or complete closure of some health facilities.
- Perceived barriers to access, such as geographical, financial, and sociocultural barriers, also negatively impact the use of health services, especially for marginalized and vulnerable populations.

- There is evidence that the SARS-CoV-2-related mortality in the general population, high risk of virus infection, and workload affect access to healthcare by the consequences posted on healthcare workers.
- Telemedicine could improve access and continuity of care by reducing geographic, physical or financial barriers, but the pivot of services to virtual care may not be equitable due to multiple barriers associated with the level of need and sociodemographic factors.
- Indicators measuring the supply of and demand for (essential) medicines, PPE, and other critical medical equipment (ventilators, dialysis materials), are necessary to follow the waning capacity and the quality of health services.
- The quality of healthcare services can be compromised as an indirect effect of the pandemic by service readiness, the ability of facilities to provide adequate supplies and staffing, timely delivering of services, increase in health complications, prescribing practices, resources utilization, lack of linkage with PHC service providers for continuity of care and partial or complete closure of some health facilities.
- The amount of government spending on health reflects the level of prioritization by the government as well as the sustainability of financing. Health spending and health outcomes are also shaped by other social spending, particularly on education and social protection. Low levels of public investment in health correlates with high levels of compensatory out-of-pocket spending, and increased risk of poverty.
- The COVID-19 pandemic and the containment measures impacted other areas of wellbeing, with some of the most significant negative consequences seen in employment and income loss, unpaid labor, education, food security, and personal safety, affecting mostly women. Economic/financial instability, loss of employment, social isolation and stay-home orders, disrupt family routines, increase demands of caregiving and reduce social support and recreational downtime, impacting mental health outcomes.
- Containment measures, reductions in awareness and educational public health campaigns also impact people's behavior, leading to increased risk factors (alcohol use, tobacco use, physical activity reduction, and diet quality among others). Also, containment measures impact other wider determinants of health as income, education, transport behavior, and access to essential services.
- Despite the importance of early childhood education, countries' mitigation measures and concern for learning losses prioritize other educational levels and not pre-primary, potentially harming childhood development.
- The pandemic's wide-reaching impacts underscored the need for timely surveillance of physical, economic, and social conditions, to enable early detection of vulnerable groups and prompt action to mitigate health inequities.
- The pandemic's wide-reaching impacts also underscored the need for timely surveillance of physical, economic, and social conditions, also known broadly as social determinants of health (SDOH), to enable early detection of vulnerable groups and prompt action to mitigate health inequities.
- While the origins of SARS-CoV-2 have not been determined definitively, the pandemic has nevertheless drawn attention to the impact of environmental degradation and the possible

**UNED**

effects of changes in land use on the spillover of disease from animals to humans. Other environmental effects were identified, due to some interventions mandating or recommending the closure of public transport or a reduced capacity of passenger transport or transport behavior.

- The decrease in physical activity, income and reductions, changes in other infectious disease rates, the increase in health risk factors as changes in the quantity and quality of food and overall diet, use of tobacco, alcohol and other drugs; and the disruptions in health care including screening, treatment, self-care and surveillance among others, had negatively impacted mental health, well-being, quality of life, sleep patterns, morbidity and mortality.
- The frameworks identified were mainly focused on non-communicable diseases and COVID-19. The main pathways were Impaired healthcare for non-COVID-19 conditions (Access), direct effects of containment measures, indirect effects of containment measures through risk factors and also health outcomes assessment.
- Some of the surveillance systems were focused on behavioral tendencies and mental disorders as the pandemic consequence. Others identified, tracked and monitored COVID-19 trends among the general population.

**Table 2. Mechanisms underlying the main pathways of the wider effects of the COVID-19 pandemic and related indicator areas.**

**2.1 Direct effects of COVID-19 outbreak.**

Main pathway	Underlying Mechanism	Indicator area
<b>Fear of getting infected or spreading infection</b>	Concerns regarding themselves or loved ones contracting COVID19, uncertainty over employment and financial hardships, fear of the unknown, social isolation as a result of pandemic measures (lockdowns, physical distancing, etc.), and worries associated with following and/or others not abiding by guidelines increase psychological distress (44,52)	Psychological distress
	Variation in antibiotics prescription is likely to be explained, on the supply side, by differences in the guidelines and incentives that govern primary care prescribers and uptake of e-prescribing solutions and, on the demand side, by differences in attitudes and expectations regarding optimal treatment of infectious illness (79). This is an important outcome measure of quality and safety of care. The over-, under- or misuse of antibiotics can cause negative health consequences at both individual and population levels (e.g., antibiotic resistance) (83).	Antibiotics prescription and consumption patterns
	Hampered non-COVID-19 health services such as TB surveillance resulting in a drop in diagnosis of new cases of active TB which could potentially result in a surge in number of patients with TB once the lockdown is lifted; Worsening of the increase in TB transmission due to the social, economic and biomedical consequences of the pandemic; TB patients may develop multidrug resistance and superinfection by COVID-19 (21).	Emergence and spread of drug-resistant pathogens

**2.2 Indirect effects of COVID-19 outbreak.**

Main pathways	Underlying Mechanism	Indicator area
<b>Impaired health care for non- COVID-19 conditions: access</b>	Control measures including lockdown, social distancing among others, had affected routine health care programs with disruption of routine preventive and curative health services among others. Fears of contracting the disease in health facilities, staff shortage due to reassignment of health care workers to support the COVID-19 outbreak response, stock-out of vaccines and other supplies, the need to postpone health programs and partial or complete closure of some health facilities derives in unmet health care needs (40). Although COVID-19 adversely affects people's lives in many respects, it disproportionately impacts certain groups and populations (32).	Unmet health care needs
	Staff shortage due to reassignment of health care workers to support the COVID-19 outbreak response, and partial	Waiting times

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

	<p>or complete closure of some health facilities (40). High hospital admission/ discharge rates can also signal a failure of PHC service delivery that has necessitated hospital admissions. This measures a health system's performance in terms of providing timely access to essential health services to individuals in need (83).</p>	
	<p>The pandemic and social and movement measures implemented thus far have had heterogeneous effects on national health systems, both directly in terms of cases and deaths and indirectly by disrupting essential health services (82). Movement restrictions have caused disruptions to the screening, treatment, self-care and surveillance of patients (25) and lockdown, economic hardship and the psychological impact of the pandemic all had a detrimental effect on people with chronic diseases (55). The use of primary care services can indicate high use in periods of epidemic exacerbation or underuse due to stay-at-home recommendations or fear of patients to use primary care services. A non-responsive system may lead to delays in diagnosis and treatment of other treatable diseases (70). Utilization of care can be a predictor of access to primary care (83). Also implementation of COVID-19-related public health measures, such as physical distancing, travel restrictions and emphasis on hygiene, is likely to have contributed to the lower-than-expected notification numbers (36,37).</p>	<p>Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)</p>
	<p>Perceived barriers to access can negatively impact the use of health services, especially for marginalized and vulnerable populations. A perceived barrier during one visit can impact on future use of services. Addressing barriers to access and use of health services is critical for ensuring equitable delivery and use of health services (83).</p>	<p>Patient-Reported Experience Measures (PREMs)</p>
	<p>Presence of medical staff is a critical component for health service delivery and quality. Low levels of staff availability may preclude people from accessing the care that they require (83). Overwhelmed health system capacity and vulnerability of health personnel to COVID-19 infections (23,72) results in decreased human resources for health. It has been estimated, in the World Health Report 2006, that countries with fewer human resources for health generally fail to achieve adequate coverage rates for selected PHC interventions as prioritized by the Millennium Development Goals framework. Presence of medical staff is a critical component for health service delivery and quality (83).</p>	<p>Human resources for health / workload COVID-19 infections and quarantines among health care staff</p>
	<p>SARS-CoV-2-related mortalities in the general population, high risk of virus infection and workload contributes to an increased likelihood of depression or other mental disorder (69).</p>	<p>Stress / well-being among health care staff</p>
	<p>Geographic access, physical or financial barriers, being part of stigmatized groups are barriers to access to health care services. Receiving health care remotely can mitigate some of these barriers. Advances in ICT can improve access to health (83). In compliance with public health measures, many services have pivoted to virtual care. While this shift has been crucial in providing swift services and ensuring continuity of healthcare by reducing the deleterious effects of pandemic-related restrictions (i.e., isolation), it may not be equitable due to multiple barriers associated with level of need and sociodemographic factors (44).</p>	<p>Telemedicine consults</p>

	Affordable access to medicines is essential to achieving effective universal health coverage, access includes whether medicines hold marketing authorization (i.e. have regulatory approval), whether they are affordable to individuals and the health system, and whether they are available and physically accessible (33,83). Factors that can adversely affect access include high prices and large out of pocket costs; launch strategies by companies; delay in or denial of coverage or reimbursement; and importantly, individual health system characteristics (33). As the COVID-19 pandemic has caused major disruptions in all aspects of life, it also can impact difficult to access pharmacological treatment (21).	Supply of and demand for (essential) medicines
	Respiratory protection equipment is vital IPC material for in COVID-19. Early in the pandemic there was insufficient stock for all healthcare facilities, in Europe and globally (70).	Supply of and demand for PPE
	During periods of COVID-19 surge, the waning capacity of hospitals, intensive care units (ICUs), and equipment (e.g., ventilators) becomes a critical signal of potential increases in case of fatalities (31).	Supply of and demand for other critical medical equipment (ventilators, dialysis materials)
<b>New identified indicator areas</b>		
	Access to essential diagnostics is a central component of quality health services (83). Some tests decreased after the pandemic (81).	Supply of and demand for diagnostic tests
	Due to restrictions in access to general practitioners and number of routine referrals because of periods of lockdown and increased pressure on hospitals (64).	Supply of and demand for surgery
<b>Impaired health care for non- COVID-19 conditions: quality</b>	Long-term care facilities have been heavily affected by COVID-19 with a high proportion of facilities across some countries and residents in these affected settings causing high morbidity and mortality in this vulnerable group. Data on the proportion of affected long-term care facilities would provide a better understanding of the situation in the country and across countries. (70) Health care quality can be measured through service readiness, the ability of facilities to provide adequate supplies and staffing, clinical outcomes that reflect the provision of appropriate care in hospitals, the process of travel/transport to the hospital in a timely manner, the inability of the primary care system to manage patients and avoid complications, avoidable hospital admissions, prescribing practices to assess safety, resource utilization rate that may reflect poor confidence in services, concerns over affordability of hospital services or services congestion (83). A lack of linkage with PHC service providers for continuity of care for discharged patients can impact quality of primary care. Health worker shortages may result in increased caseloads per provider, potentially compromising service quality. Conversely, low caseloads can also contribute to decreased	Health care quality in various settings (for example, primary care, hospital care, acute care)

	quality of care (e.g., through decreased provider motivation, increased absenteeism, and fewer opportunities to practice skills) or serve as a sign of poor availability of care or services (83).	
	This is an important outcome measure of quality and safety of care. The over-, under- or misuse of antibiotics can cause negative health consequences at both individual and population levels (e.g., antibiotic resistance) (83).	Patient safety /adverse effects
	When occupancy rates are high, interventions to increase patient turnover - reducing length of stay and avoiding inappropriate admissions - have an impact on caseload and requires adaptation of staffing norms per bed (83)	Average length of stay in hospital for (specific) non-COVID-19 conditions
	Patient-reported experiences provide critical insight into the quality of care received. They broadly reflect perceptions of health care from the patient perspective, described across three categories: patient experience, patient satisfaction and health system responsiveness (83).	Patient-Reported Experience Measures (PREMs)
	Adherence to clinical guidelines improves patient outcomes (83).	Adherence to medical guidelines
<b>Impaired health care for non-COVID-19 conditions: financial protection</b>	The amount of government spending on health devoted to PHC reflects the level of prioritization of PHC by the government as well as the sustainability of financing for PHC (83). The COVID19 pandemic forced a shift in government spending. A wide range of reasons may contribute to these, such as distribution channels, availability of generic medicines, access to prescribed medicines, prevalence of self-medication and relative prices (87).	Public spending on health (by function, provision, illness)
	Government spending on health does not exist in a vacuum; health spending and health outcomes are also shaped by other social spending, particularly on education and social protection. The COVID19 pandemic forced a shift in government spending (87).	Public spending on social services
	Low levels of public investment in health correlates with high levels of compensatory out-of-pocket spending, and heightened risk of slipping into poverty or suffering financial catastrophe during a pandemic (88). Informality, inequality, poverty, and lack of political representation, result in a disproportionate impact of the pandemic on the most vulnerable (72). A health system that relies heavily on OOPS has a higher financial burden for households, particularly poor ones (87).	Out-of-pocket payments
	Low levels of public investment in health correlates with high levels of compensatory out-of-pocket spending, and heightened risk of slipping into poverty or suffering financial catastrophe during a pandemic (86).	Catastrophic and impoverishing health spending

	The COVID-19 pandemic has impacted other sectors of well-being, with some of the most significant negative consequences seen in employment and income loss, unpaid labor, education, food security, and personal safety. The economic downturn has affected women more severely than men (38).	Unmet needs
	<b>New identified indicator areas</b>	
	The distribution of sources for expenditure on health reflects the mix of resources available to support a country's health system, indicating the government's overall contribution to funding health care relative to other sources of funding from domestic private and external sources (83).	Funding and allocation of resources
	Not reported	Personal spending
	The way in which providers are paid is one of the most powerful ways to influence the performance of providers, from several perspectives, including the quality and efficiency of services provided (83).	Purchasing and payment systems

### 2.3 Direct effects of containment measures

Main pathways	Underlying Mechanism	Indicator area
<b>Direct effects of containment measures</b>	Poverty, quarantine and mandatory lockdown, socioeconomic level predisposes to living in overcrowded conditions. The degree of household overcrowding is a factor that increases the probability that coronavirus will be transmitted and spread (81).	Household size
	Measures in vulnerable individuals living in the community and those resident in facilities such as long-term care facilities, psychiatric institutions, homeless shelters or prisons can include visitor restrictions (70).	Loneliness
	The prevalence of insomnia, anxiety, depression and obesity increased with increasing phone screen time among university students (8).	Work-life balance
	COVID-19 pandemic has caused impacts on other sectors of wellbeing with negative consequences seen in unpaid labor, education, food security, and personal safety. The economic downturn has affected women more severely than men (38). Pervasive economic/financial instability; loss of employment; social isolation and stay-home orders; concern over own health and health of family members; family stress (i.e., disruption of family routines, loss of respite, interpersonal conflict); increased demands of caregiving including responsibilities to dependents; loss of pre pandemic educational and childcare supports; and loss of recreational downtime; impact mental health outcomes among caregivers of youth during (44).	Time spent on unpaid domestic and care work

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

	Pervasive economic/financial instability; loss of employment; social isolation and stay-home orders; concern over own health and health of family members; family stress (i.e., disruption of family routines, loss of respite, interpersonal conflict); increased demands of caregiving including responsibilities to dependents; loss of pre pandemic educational and childcare supports; and loss of recreational downtime; impact mental health outcomes among caregivers of youth during (44).	Time spent outside / time for leisure activities
	Confinement measures adopted by governments induced a large immediate drop-in economic activity and influenced mental health (11,75). Also lockdown across the country and strict isolation and social distancing measures, delay in prevailing educational system, sudden closure of classes, are expected to influence the mental health of the students of several schools, colleges and universities across the country (53).	Psychological distress
	COVID-19 pandemic impacts on other sectors of wellbeing with some of the most significant negative consequences seen in employment and income loss, unpaid labor, education, food security, and personal safety. The economic downturn has affected women more severely than men (38). Financial strain, indebtedness and the inability to provide materially for one's family may increase stress and household conflict, undermine personal autonomy and induce feelings of shame and guilt (6).	Interpersonal violence (intimate partner violence, child maltreatment, elderly abuse)
	People being part of socially vulnerable populations may find it difficult to adhere to the public health measures required during the COVID-19 pandemic (70).	Social support
	People being part of socially vulnerable populations may find it difficult to adhere to the public health measures required during the COVID-19 pandemic (70). Mobile apps to support contact tracing could help complement manual contact tracing and it is important to understand population coverage as it is related to effectiveness (70).	Adherence to containment measures such as hygiene and physical distancing measures

## 2.4 Indirect effects of containment measures

Main pathways	Underlying Mechanism	Indicator area
<b>Indirect effects of containment measures</b>	COVID-19 pandemic (and the implemented public health measures) impact people's behavior, their health status and well-being (43). The indirect effects of containment measures may include changes in the use of tobacco, alcohol and other drugs (39).	Tobacco use

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

<b>through risk factors</b>	COVID-19 pandemic (and the implemented public health measures) impact people’s behavior, their health status and well-being (43).The indirect effects of containment measures may include changes in the use of tobacco, alcohol and other drugs (39).	Alcohol use
	COVID-19 pandemic (and the implemented public health measures) impact people’s behavior, their health status and well-being (43). The indirect effects may include reductions in awareness and educational public health campaigns for noncommunicable diseases and reduced physical activity (39).	Physical activity
	Lockdown, economic hardship and the psychological impact of the pandemic all had a detrimental effect on people with liver disease, including poorer metabolic control (55).	Overweight/obesity
	Lockdown, economic hardship and the psychological impact of the pandemic all had a detrimental effect on people with liver disease, including poorer metabolic control (55).	Hypertension
	Lockdown, economic hardship and the psychological impact of the pandemic all had a detrimental effect on people with liver disease, including poorer metabolic control (55).	High cholesterol
	COVID-19 pandemic has caused major disruptions in all aspects of life, with some of the most significant impacts in employment and income loss, unpaid labor, education, food security, and personal safety (38). The indirect effects of containment measures may include changes in the quantity and quality of food and overall diet; use of tobacco, alcohol and other drugs; changes in other infectious disease rates. Such changes in the behavioral and intermediate risk factors related to noncommunicable diseases could significantly increase or decrease their prevalence in the population (39).	Diet
	COVID-19 pandemic (and the implemented public health measures) impact people’s behavior, their health status and well-being (43).The indirect effects of containment measures may include changes in the use of tobacco, alcohol and other drugs (39).	Illicit drug use
	<b>New identified indicator areas</b>	
The indirect health effects of the COVID-19 pandemic may include use of tobacco, alcohol and other drugs (39).	Other substances use	
<b>Indirect effects of containment measures through wider determinants of health</b>	Confinement measures adopted by governments induced a large immediate drop in economic activity (75).The World Bank’s latest publication on the impact of COVID-19 on global poverty and inequality shows a reversal of the gains in global poverty with job losses and deprivation induced by the pandemic (88). As the COVID-19 pandemic has caused major disruptions in all aspects of life, its impacts on other sectors of wellbeing are expected to be profound and widespread, with some of the most significant negative consequences seen in employment and income loss, unpaid labor, education, food security, and personal safety. The economic downturn has affected	Income / (at risk of) poverty

	women more severely than men, partly reversing progress towards gender equality that had been made in many countries. (38)	
	Tax measures to address the COVID-19 crisis and the consequent economic slowdown are taking a toll on tax revenues. Fiscal policy is playing an essential role in mitigating the negative economic and social effects of the pandemic and will continue to be pivotal for the recovery. (75).	Public spending on essential services
	As the COVID-19 pandemic has caused major disruptions in all aspects of life, its impacts on other sectors of wellbeing are expected to be profound and widespread, with some of the most significant negative consequences seen in employment and income loss, unpaid labor, education, food security, and personal safety (43). In a number of countries, the pandemic has impacted the school-to-work transition of youth negatively (73).	Unemployment
	Self-employed people and workers in the informal sector, who tend to have lower wages (or none in family businesses), are also reported to be severely hit by social and movement measures (88).	Workers on flexible contracts / informal workers
	Preventing contact among children is a known prevention measure in influenza outbreaks and pandemics (70). During closure of face-to-face schooling, many children miss regular education, which could result in loss of more than half a year of effective basic learning in a child schooling globally (88). COVID-19 pandemic has caused major disruptions in all aspects of life, with some of the most significant impacts in employment and income loss, unpaid labor, education, food security, and personal safety (38).	Education
	Despite the importance of early childhood education, countries' mitigation measures and concern for learning losses prioritize other educational levels and not pre-primary (89).	Childhood development
	The pandemic's wide-reaching impacts underscored the need for timely surveillance of physical, economic, and social conditions, to enable early detection of vulnerable groups and prompt action to mitigate health inequities (24).	Air quality
	Interventions mandating or recommending the closure of public transport or a reduced capacity of passenger transport (70).	Transport behavior
	<b>New identified indicator areas</b>	
	Social and movement measures in the context of COVID-19 require detailed understanding of the current health and socio-economic situation and of the feasibility, acceptability and financial resources required for those measures and the economic response. Direct support to individuals and households to sustain their income and living conditions includes wage subsidies, unemployment benefits, cash transfers and/or in-kind donations. Indirect measures include financial support to households to pay utility bills, loans or mortgages and deferral or	Access to financial institutions/government financial support

	subsidization of other costs (e.g., rent, utility bills, interest payments) (88).	
	The pandemic's wide-reaching impacts also underscored the need for timely surveillance of physical, economic, and social conditions, also known broadly as social determinants of health (SDOH), to enable early detection of vulnerable groups and prompt action to mitigate health inequities (23). While the origins of SARS-CoV-2 have not been determined definitively, the pandemic has nevertheless drawn attention to the impact of environmental degradation and the possible effects of changes in land use on the spillover of disease from animals to humans (78).	Other environmental effects

## 2.5 Health outcomes

Underlying Mechanism	Indicator area
COVID-19 has both mental/emotional and social implications for pregnant and postpartum women who have been physically separated from families, relatives, and society all around the world (14). Financial strain, indebtedness and the inability to provide materially for one's family may increase stress and household conflict, undermine personal autonomy and induce feelings of shame and guilt (6).	General health and well-being: Self-perceived (mental) health
Quality of life was not largely affected in adolescents following COVID-19, but there might be greater impairment in young children and in those with more severe forms of the disease (12). The decrease in physical activity, the cessation of the intervention of the recovery and the social distance imposed by the lockdown, has had a negative impact on the physical and mental health, quality of life, daily activities, as well as on the behavioral attitudes of the diet (17).	General health and well-being: Quality of life
The COVID-19 pandemic affected sleep patterns positively for some individuals, but negatively for others (43). Misinformation on social media that leads to public panic also contributes (58).	General health and well-being: Sleep
Loneliness and isolation due to the lack of physical and social contact with other family members and friends may negatively impact health and wellbeing (45).	General health and well-being: Patient-Reported Outcome Measures (PROMs)
Movement restrictions have caused disruptions to the screening, treatment, self-care and surveillance of NCD patients (25). The indirect effects may include denied or delayed disease prevention and medical procedures for acute and chronic conditions; reductions in awareness and educational public health campaigns for noncommunicable diseases; reduced physical activity; losses of jobs and income and reductions in overall living status; disruption of social networks; increases in self-harm and anxieties over contracting the disease; changes in the quantity and quality of food and overall diet; use of tobacco, alcohol and other drugs; changes in other infectious disease rates. Such changes in the behavioral and intermediate risk factors related to noncommunicable diseases could significantly increase or decrease their prevalence in the population (39). Lockdown, economic hardship and the psychological impact of the pandemic all had a detrimental effect on people's chronic	Morbidity: Occurrence of chronic diseases

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

diseases (68) Also, high morbidity and mortality will occur if there is insufficient capacity to hospitalize severe cases (90).	
People who were unemployed or experiencing financial difficulties reported higher rates of anxiety and depression than the general population during the COVID-19 crisis (79).	Morbidity: Occurrence of mental disorders
COVID-19 has impacted the maintenance of vaccination programs due to the system's inability to maintain essential health programs (70). Fears of contracting the disease in health facilities, staff shortage due to reassignment of health care workers to support the COVID-19 outbreak response, stock-out of vaccines and other supplies, and the need to postpone health programs and partial or complete closure of some health facilities contributes (40).	Morbidity: Occurrence of (vaccine-preventable) infectious diseases
Changes may be related to the COVID-19 pandemic's effects on health systems (23).	Mortality: Excess mortality
People living with NCDs are at higher risk of more severe infection and mortality due to COVID19, and the movement restrictions have already caused disruptions to the screening, treatment, self-care and surveillance of NCD patients (25). Mortality has been shown to increase in people with chronic disease due to the impact of the COVID-19 pandemic on the diagnosis and management programs (55).	Mortality: Mortality from chronic diseases
Not reported	Mortality: Mortality from infectious diseases other than COVID-19
Not reported	Mortality: Fatal injuries (including suicide)
Restrictions on reproductive health services during the pandemic (81).	Mortality: Maternal mortality
Indicators of avoidable mortality offer a general "starting point" to assess the effectiveness of public health and health care systems in reducing deaths from various diseases and injuries (79).	Mortality: Avoidable mortality
<b>New identified indicator areas</b>	
The COVID-19 pandemic led to important indirect health and social harms in addition to deaths and morbidity due to SARS-CoV-2 infection. These indirect impacts, such as increased depression and substance abuse, can have persistent effects over the life course. Estimated health and cost outcomes of such conditions and mitigation strategies may guide public health responses (35,46)	Morbidity: cost-effectiveness
The pandemic may affect fertility through many different mechanisms through three main channels: (i) changes in "demand for children"; (ii) changes in reproductive capacity or the "supply of children"; and (iii) changes in intermediate variables, particularly sexual activity, marriage rates, access to contraception and abortion (89).	Sexual/reproductive health
Due to restriction in access to general practitioners and number of routine referrals because of periods of lockdown and increased	Survival

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

pressure on hospitals (64).	
-----------------------------	--

**Table 3. List of core indicators**

**3.1 Direct effects of COVID-19 Outbreak**

Pathway	Indicator	Metadata/Calculation <sup>1</sup>	Relevant disaggregation	Data source type <sup>2</sup>	Frequency
Psychological distress	Anxiety of self or others contracting COVID (44)	Level of concern over self-and/or someone close developing COVID-19 was assessed on two original items via five-point unipolar Likert scales (1=extremely worried, 5=not worried at all). Individuals registered with AskingCanadians, whose profile matched a priori quotas, web survey		Online survey	
	COVID-19-Related Fear (52)			Online survey <ul style="list-style-type: none"> <li>Fear of COVID-19 Scale: This 7-item scale is used to measure fears related to the ongoing COVID-19 pandemic. Participants are asked to rate the extent to which they have been bothered by each item during the pandemic on a five-point scale ranging from 1 (strongly disagree) to 5 (strongly agree). Total score ranged from 7 to 35.</li> </ul>	
	Somatic Symptoms (52)			Online survey	

<sup>1</sup> Metadata/calculations, this domain includes where the information can be found or how the indicator can be calculated, if available.

				<ul style="list-style-type: none"> <li>The Somatic Symptom Scale-8<sup>3</sup></li> </ul>	
	Anxiety (52)			Online survey <ul style="list-style-type: none"> <li>The Generalized Anxiety Disorder-7<sup>4</sup></li> </ul>	
	Depression(52)			Online survey <ul style="list-style-type: none"> <li>The Centre for Epidemiologic Studies Depression Scale<sup>5</sup></li> </ul>	
	Fear of infection (81)				
Antibiotics prescription and consumption patterns	Safe primary care attention (77)	Antibiotics prescribed (defined daily dose per 1000 people)		Online survey	
Emergence and spread of drug-resistant pathogens.	TB multidrug resistance and superinfection (21)	TB multidrug resistance and superinfection			

### 3.2 Indirect effects of COVID-19 Outbreak

#### 3.2.1 Access

Pathway	Indicator	Metadata/Calculation <sup>6</sup>	Relevant disaggregation	Data source type <sup>7</sup>	Frequency
Unmet health care needs	Percentages of households whose members could not receive medical attention (89)				

<sup>3</sup> Assess the participants for stomach problems, fatigue, back pain, headache, sleeping troubles, dizziness, shortness of breath, and pain in arms, legs, and joints. The SSS-8 is an 8-item self-report questionnaire, rated on a five-point Likert scale, ranging from 0 (not at all) to 4 (very much).

<sup>4</sup> GAD-7 is a 7- item measure, rated on a four-point Likert scale, ranging from 0 (not at all) to 3 (nearly every day).

<sup>5</sup> The CES-D is a 20-item measure, rated on a four-point Likert scale, with responses ranging from 0 (rarely or none of the time) to 3 (most or all of the time). The scale measures six facets of depression: depressed mood, feelings of guilt and worthlessness, feelings of helplessness and hopelessness, psychomotor retardation, loss of appetite, and sleep disturbance.

<sup>6</sup> Metadata/calculations, this domain includes where the information can be found or how the indicator can be calculated, if available.

	Health spending (79)	Total health spending (per capita, USD using purchasing power parities)			

<sup>13</sup> Metadata/calculations, this domain includes where the information can be found or how the indicator can be calculated, if available.

<sup>14</sup> Source: This domain includes the tool, scale or mechanism used to capture the data

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

	Current expenditure on health (total and PHC-specific) as a percentage of GDP (83)	<b>Numerator:</b> Sum of all current expenditure on health (12-month period). <b>Denominator:</b> GDP National health account (NHA) Existing data collection tool: OECD and World Health Organization. Guidelines for the implementation of the SHA 2011 framework for accounting health care financing. OECD; 2014 ( <a href="https://www.who.int/health-topics/health-accounts#tab=tab_1">https://www.who.int/health-topics/health-accounts#tab=tab_1</a> , accessed 18 August 2021)		Total (and PHC-specific) current expenditure on health as a percentage of GDP <sup>15</sup>	
	Per capita total health expenditure (and PHC-specific) (83)	<b>Numerator:</b> Total health expenditure and Total current PHC expenditure (in U.S. dollars) <b>Denominator:</b> Population count NHA Existing data collection tool: OECD and World Health Organization. Guidelines for the implementation of the SHA 2011 framework for accounting health care financing. OECD	PHC-specific expenditure Source of funding (e.g., GGHE-D, private, external)	Per capita health expenditure (total and PHC-specific) <sup>4</sup>	
	Government PHC spending as percentage of	Numerator Government expenditure on PHC		NHA	

<sup>15</sup> Notes on calculation of PHC expenditure based on SHA2011 methodology include:

- General outpatient curative care (HC.1.3.1) - such as visits to a general practitioner or nurse
- Dental outpatient curative care (HC.1.3.2) - such as visits for regular control and other oral treatment
- Curative outpatient care not elsewhere classified. (HC.1.3.nec), excluding specialized outpatient care.
- Home-based curative care (HC.1.4), such as home visits by a general practitioner or nurse
- Outpatient (HC.3.3) and home-based (HC.3.4) long-term health care
- Preventive care (HC.6), such as immunization, health check-ups, health education, disease detection, monitoring and emergency response programmes
- Part of medical goods provided outside health care services (80% of HC.5)
- Part of health system administration and governance costs (80% of HC.7)

The medical goods category under the HC classification includes medicines purchased outside the inpatient and outpatient setting (in pharmacies and markets) or paid for separately from the consultation fee. The PHC component of medical goods includes only those for general outpatient use and self-prescribed medicine. It does not include medical goods for specialized outpatient and inpatient services. Following these criteria and assuming most spending recorded for medical goods is for PHC, 80% of medical goods spending was attributed to PHC spending under this global definition.

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

	government health expenditure (83)	<b>Denominator:</b> General government expenditure on health NHA			
	Current health expenditure (% GDP). (34)	Current health expenditure (% GDP). WHO Global Health Expenditure database			
	Government expenditure on health (34)	Government expenditure on health (% of total government expenditure) WHO Global Health Expenditure database			
	Government spending on health as a share of GDP (87)	Government spending on health in the period (% of GDP per capita, in the period (US\$)) International Monetary Fund's (IMF) Government Finance Statistics database or the World Bank's World Development Indicators database		Government social spending includes three main components: health, education and social protection <sup>16</sup> .	Annual
	Average income elasticity of growth (the ratio of growth in spending to growth in income) (87)	Compound annual growth in government spending on health (%) compared to Compound annual growth in gross domestic product (%) International Monetary Fund's (IMF) Government Finance Statistics database or the World Bank's World Development Indicators database		Government social spending includes three main components: health, education and social protection <sup>5</sup> .	Annual

<sup>16</sup> Government spending on health refers to domestic general government health expenditure, which is government spending from domestic financing sources. Data are from the WHO Global Health Expenditure Database. Government spending on education encompasses all levels of education combined, from early childhood to tertiary, including expenditure funded by transfers from external sources to government. Government spending on social protection consists of cash and in-kind benefits provided to targeted individuals and households, including people with sickness and disability, survivors of a deceased person, households with dependent children and other socially excluded groups. It also includes transfers and services provided on a collective basis, including old-age pension schemes, unemployment insurance and housing. The data are from the IMF's Government Finance Statistics database.

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

	Government and donor spending on PHC, by type of service (87)	Government and donor spending on primary health care (PHC) as a share of gross domestic product (GDP)(%) <sup>17</sup> . The global measure of PHC spending in the Global Health Expenditure Database			Annual
	Pharmaceutical spending as a share of total health spending (%) (87)	Pharmaceutical spending as a share of total health spending (%)		Retail pharmaceuticals, a subcategory of medical goods, includes prescription medicines and self-medication, which is often referred to as over-the-counter products <sup>18</sup> . 	Per capita spending on over-the-counter medicines (US\$) compared to Per capita spending on prescribed medicines (US\$) (87)	Per capita spending on over-the-counter medicines (US\$) compared to Per capita spending on prescribed medicines (US\$)		Retail pharmaceuticals, a subcategory of medical goods, includes prescription medicines and self-medication, which is often referred to as over-the-counter products <sup>7</sup> .	Annual
Public spending on social services	Government spending on education as a share of GDP (87)	Government spending on education in the period (% of GDP per capita, in the period (US\$)) Data are from the International Monetary Fund's (IMF) Government Finance Statistics database or the World Bank's World Development Indicators database			Annual
	Government spending on social protection as a share of GDP (87)	Government spending on social protection in the period (% of GDP per capita, in the period (US\$))			Annual

<sup>17</sup> The following spending categories from the classification of health care function are considered part of PHC spending for the global measure: • Unspecialized outpatient care (including general and dental outpatient curative care, home-based curative care, outpatient and home-based long-term health care, and unclassified outpatient care). • Preventive care • 80% of spending on medical goods purchased as a result of consultation and self-treatment. • 80% of spending on health system governance and administration.

<sup>18</sup> The subcategory excludes non-durable medical goods (such as hypodermic syringes, hot-water bottles, ice bags and the like), therapeutic appliances (glasses, hearing aids and the like), vaccines (which are included under preventive care under the System of National Accounts 2011), and pharmaceuticals consumed in hospitals and other health care settings. Spending on pharmaceuticals includes wholesale and retail margins and value-added tax. In most countries, total spending on pharmaceuticals refers to net spending—that is, adjusted for rebates from manufacturers, wholesalers or pharmacies.

		Data are from the International Monetary Fund's (IMF) Government Finance Statistics database or the World Bank's World Development Indicators database			
	Average income elasticity of growth (the ratio of growth in spending to growth in income) (87)	Compound annual growth in government spending on education, (%) compared to Compound annual growth in gross domestic product (%) Data are from the International Monetary Fund's (IMF) Government Finance Statistics database or the World Bank's World Development Indicators database			Annual
Out-of-pocket payments	Out-of-pocket health expenditures per capita, purchasing power parity (current international dollars) (72)				
	Out of pocket payments (79,81)				
	Lack of money (81)				
	Affordability Patient affordability: Out-of-pocket (OOP) cost of treatment relative to wage (patient level) (33)	Cost of per person treatment for a defined time period (monthly, annually) – based on patient OOP contribution. Average population wage		Survey Relevant authority (internal) database or website, provided by expert through survey, national statistics	Monthly, Annual
	Out-of-pocket expenditure (34)	% of total health expenditure		WHO Global Health Expenditure database	
	OOPS <sup>19</sup> (87)	(% of total health spending)		household surveys national accounts	Annual

<sup>19</sup> OOPS is usually estimated by multiplying the share of OOPS in total household consumption (from household surveys) by total final private consumption (from national accounts). This method is based on the fact that in a given country, OOPS is strongly correlated with private consumption.

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

		Annual growth in out-of-pocket spending per capita (%)			
Funding and allocation of resources	Sources of expenditure on health including out-of-pocket (and PHC-specific) (83)	<b>Numerator:</b> Total expenditure on health from each relevant source (government schemes, compulsory contributory health care financing, voluntary health care payment schemes, household out-of-pocket, rest of world financing schemes, other) <b>Denominator:</b> Total expenditure on health NHA	PHC-specific expenditure Source: out of pocket, domestic government, external	NHA	
Personal spending	ACCRA Cost of Living Index (23)	Fruit and vegetable price index and fast-food price index - based on the food prices available			Annual
Purchasing and payment systems	Purchasing and provider payment methods <sup>20</sup> are in place (including in primary care) (83)			Qualitative assessment based on interview with key informant and/or desk review of country documents	
	Purchasing and payment systems <sup>21</sup> (83)			Qualitative assessment based on interview with key informant and/or desk review of country documents.	
Access to financial institutions/government financial support	Households that could not access a financial institution when necessary (88)		Households that could not access a financial institution when necessary because of movement restrictions		
	Safety nets (88)	<ul style="list-style-type: none"> <li>Households that had received any form of</li> </ul>			

<sup>20</sup> Appropriate provider payment methods are in place as measured against the following criteria: • Payment of providers is driven by information on the health needs of the population they serve • Provider payments harmonized within and across purchasers to ensure coherent incentives for providers • Purchasing arrangements promote quality of care • Provider payment methods and complementary administrative mechanisms address potential over- or underprovision of services • Information on providers' activities captured by purchasers adequate to guide purchasing decisions • Providers have financial autonomy and are held accountable

<sup>21</sup> Health financing (or access to HBP or insurance scheme) follows WHO-recommended guidelines, including following criteria: • Population entitlements and conditions of access defined explicitly and in easy-to-understand terms • User charges are designed to ensure financial obligations are clear and have functioning protection mechanisms for patients • Defined benefits aligned with available revenues, available health services, and purchasing mechanisms.

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

<sup>28</sup> 18 items on a four-point Likert scale and is designed to measure sleep disturbances and sleep habits over a one-month period. It includes questions about time of bed, the number of hours of sleep per night, wake up time, and the time it takes to fall asleep. It also includes statements such as “during the past month how often have you had trouble sleeping because you have bad dreams” and “how would you rate your overall quality of sleep”. Each statement is scored between 0 [not during the past month] and 3 [three or more times a week]. Statements are broken down into seven components and converted to a point score. Higher scores indicate poorer sleep hygiene and scores >5 point to poor sleep quality. Validity and reliability have been previously reported.

<sup>29</sup> Gratitude Questionnaire [GQ-6] is a six-item self-report measure designed to quantify individual variances in the proneness to experience gratitude in daily life. Items are rated on a seven-point Likert-type scale, where 1 = strongly disagree and 7 = strongly agree and include statements like “I have so much in life to be thankful for” and “When I look at the world, I don’t see much to be grateful for”. Total score ranges between 6 and 42, with higher scores indicating higher gratitude.

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

			disaggregation		y
General health and well-being: Self-perceived (mental) health	Perceived stress			<ul style="list-style-type: none"> <li>4-item version of the Perceived Stress Scale<sup>46</sup>.</li> </ul>	Survey
	Depression and anxiety symptoms		Socioeconomic status (income, education, occupation), People with a chronic condition or disability, Monthly income (<500 JOD), Employment status (unemployed), Chronic disease (diabetes)	<ul style="list-style-type: none"> <li>Kessler Psychological Distress Scale (K10)<sup>47</sup></li> </ul>	Questionnaire self-administered questionnaire
	Anxiety symptoms over the past 2 weeks	Items n(%)		<ul style="list-style-type: none"> <li>Generalized Anxiety Disorder scale (GAD-7)<sup>48</sup> to evaluate the frequency of anxiety symptoms over the past 2 weeks.</li> </ul>	Web-based questionnaire
	Depressive symptoms over the past week			<ul style="list-style-type: none"> <li>Center for Epidemiologic Studies Depression Scale (shortened version) (CESD-10)<sup>49</sup> to assess whether participants had depressive</li> </ul>	Web-based questionnaire

<sup>46</sup> Items were rated from 0 (never) to 4 (very often). Two positively stated items (items 2 & 3) were reverse-coded, and scores were summed across all scale items. Higher values represent higher perceived stress.

<sup>47</sup> This was a 10-item questionnaire intended to yield a global measure of distress based on questions about anxiety and depressive symptoms that a person has experienced during the COVID-19 outbreak. The scale used five-value response options for each question –all of the time, most of the time, some of the time, a little of the time, and none of the time– that were scored from five through to one. The Kessler scale was tailored to study aims by adding 6 questions related to the COVID-19 and the local situation in Jordan. Therefore, the maximum score was therefore 80, indicating a severe mental problem, and the minimum score was 16, indicating well mental health. From 16 to 32 was considered well mental status, from 32 to 48 was considered mild mental status, from 48 to 64 was considered moderate mental status, and from 64 to 80 was considered severe mental status.

<sup>48</sup> Answer options for the 7 items of the measure were on a four-point Likert scale ranging from 0-3 points 'not at all', 'several days', 'over half the days', 'nearly every day' to a score ranging from '0-21'; increasing score indicates increasing functional impairment as a result of anxiety over the last 2 weeks. Feeling nervous, anxious, or on edge /Not being able to stop or control worrying /Worrying too much about different things /Trouble relaxing /Being so restless that it's hard to sit still /Becoming easily annoyed or irritable /Feeling afraid as if something awful might happen.

<sup>49</sup> Answer options for the 10 items of the measure were on a four-point Likert scale ranging from 0-3 points 'rarely or none of the time', 'some or little of the time', 'occasionally or a moderate amount of time', 'most or all of the time' with a score ranging from 0-30; increasing score indicates greater depressive symptoms during the past week. Items n(%) I was bothered by things that usually don't bother me /I had trouble keeping my mind on what I was doing /I felt depressed /I felt that everything I did was an effort /I felt hopeful about future /I felt fearful /My sleep was restless /I was happy /I felt lonely /I could not "get going."

	First liver-related event (people with NAFLD-related cirrhosis) (68)	Development of clinical events during the period, particularly a first liver-related event (LRE) <sup>52</sup> amongst persons without prior decompensations. n (%)	Type of first LRE, n (% to all LRE) Ascites, Hepatic encephalopathy, Upper gastrointestinal bleeding, HCC	Medical records	
	Cardiovascular events (people with NAFLD-related cirrhosis) (68)	Cardiovascular events: acute coronary syndrome, acute stroke, others (e.g., acute peripheral arterial syndrome). CV events, n (%)	Type of CV event, n (% to all CV) Cerebrovascular Ischemic heart disease	Medical records	
	Worsening of metabolic status (people with NAFLD-related cirrhosis) (68)	Overall worsening of metabolic status <sup>53</sup> , n (%)		Medical records	

<sup>52</sup> A first LRE was defined as the development of a clinical decompensation (ascites, hepatic encephalopathy, or upper gastrointestinal bleeding secondary to portal hypertension) or HCC. First liver event: first episode of ascites of any grade (stage 1 to 3), any grade of hepatic encephalopathy (HE) according to the West-Haven classification (stage 1 to 4), portal hypertension related bleeding, or hepatocellular carcinoma in people with compensated cirrhosis.  
 Liver events: portal hypertension-related bleeding, any grade of HE, or ascites, spontaneous bacterial peritonitis (in people with refractory ascites), hepatocellular carcinoma, and liver transplant.

<sup>53</sup> Worsening of metabolic status: Presence of at least one of the previous variables (significant weight gain and/or poor control of diabetes mellitus/arterial hypertension/dyslipidemia).

A Mental Health Surveillance System for the General Population During the COVID-19 Pandemic: Protocol for a Multiwave Cross-sectional Survey	Surveillance system	To identify, track, and monitor trends in the population in Saudi Arabia at risk of major depressive disorders and anxiety during the COVID-19 pandemic. Also mentions established health surveillance	This study used the QPlatform data collection system. All questions had to be answered for the questionnaire to be successfully submitted to the database. The interview takes approximately 8 minutes to complete. Data collection included general demographic variables, such as age, gender, region, educational level, and marital status. It also included variables related to COVID-19, such as employment category (e.g., health care professional, security, etc.), concerns	3. Direct effects of containment measures <ul style="list-style-type: none"> <li>• Psychological distress</li> </ul>

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

Study (66)		<p>surveys:          -Centers for Disease Control and Prevention's (CDC)          -National Health Interview Survey (NHIS)          -National Health and Nutrition Examination Survey (NHANES)          -Behavioral Risk Factor Surveillance System (BRFSS)</p>	<p>and worries about COVID-19, and COVID-19 incidence in family, friends, etc. In addition, other health-related risk factors, such as a history of noncommunicable diseases, obesity, physical activity, and smoking, were collected. The main mental health screening tool used was the Patient Health Questionnaire-9 (PHQ-9). Anxiety was measured using the Generalized Anxiety Disorder-7 (GAD-7). After the first draft of the survey was finalized, a linguistic validation was conducted via a focus group of 8 participants, who were asked to discuss and answer the survey as a group. According to the results of the focus group and feedback from the researchers and interviewers, the questionnaire was further edited, and a final version was produced. Following this, a pilot stage study with a small sample size will be conducted via phone interview to assess internal consistency and test the surveillance system operation plan.</p>	
Operational considerations for respiratory virus surveillance in Europe (76)	Sentinel and non-sentinel surveillance	<p>This document outlines operational considerations to support the continuity of national surveillance systems and public health laboratories for epidemiological and virological surveillance for influenza, SARS-CoV-2, and potentially other respiratory viruses (such as RSV or new viruses of public health concern) in the 2022/2023 winter season and beyond</p>	<p>Sentinel surveillance systems</p> <ul style="list-style-type: none"> <li>• Sentinel primary care surveillance: Sentinel surveillance of influenza in primary care is conducted by representative national networks of primary care practitioners. It relies on the use of syndromic case definitions for influenza-like illness (ILI) and/or acute respiratory infection (ARI). Moving Epidemic Method (MEM) thresholds have been established to compare weekly ARI and/or ILI consultation rates across countries together with respective viral data to assess the start and end as well as the intensity of respiratory virus activity in the outpatient population.</li> <li>• Severe acute respiratory infection (SARI) surveillance: hospital surveillance approach, based on laboratory-confirmed hospitalized and/or ICU-admitted influenza cases.or sentinel SARI surveillance with laboratory testing.</li> <li>• Virological testing</li> </ul> <p>Non-sentinel data sources</p>	<p>2. Impaired healthcare for non-COVID-19 conditions (quality)</p> <ul style="list-style-type: none"> <li>• Health care quality in various settings (for example, primary care, hospital care, acute care)</li> </ul> <p>Health outcomes</p> <ul style="list-style-type: none"> <li>• Mortality: Excess mortality</li> </ul> <p>5. Indirect COVID-19 health effects and potential mitigating interventions: Cost-effectiveness framework (35)	Cost-effectiveness framework	Developing a cost-effectiveness framework to evaluate societal costs and quality adjusted life years (QALYs) lost due to six health-related indirect effects of COVID-19 in California. Short- and long-term outcomes were evaluated for the adult population.	Developed a health and cost simulation tool employing a generic structure to portray the health and cost effects of COVID-19 pandemic-associated increases in prevalence of individual conditions. The model, called "Broad & Rapid Analysis of COVID-19 Indirect Effects" (BRACE), uses a cost-effectiveness framework that can portray short- and long-term health and cost effects and the impacts of mitigating interventions on health and societal costs for any condition exacerbated by the pandemic. Health outcomes include deaths and quality-adjusted life years (QALYs). Costs include both direct medical and non-medical costs. The model specifies the coverage of mitigating interventions.	<ul style="list-style-type: none"> <li>• Quality-Adjusted Life Years (QALYs) Lost</li> </ul>

<p>A National Framework to Improve Mortality, Morbidity, and Disparities Data for COVID-19 and Other Large-Scale Disasters (42)</p>	<p>National framework for data collection</p>	<p>A new report from the National Academies of Sciences, Engineering, and Medicine proposes a uniform national framework for data collection to more accurately quantify disaster related deaths, injuries, and illnesses. This article describes how following the report's recommendations could help improve the quality and timeliness of public health surveillance data during pandemics, with special attention to addressing gaps in the data necessary to understand pandemic-related health disparities</p>	<p>NASEM recommends that the Department of Health and Human Services adopt and support the use of a uniform framework for assessing pandemic-related mortality and morbidity by state, local, tribal, and territorial entities; public health agencies; and death investigation and registration systems.</p>	<p>Health outcomes</p> <ul style="list-style-type: none"> <li>• Mortality: Excess mortality</li> </ul>
<p>A Culturally Responsive Trauma-Informed Public Health Emergency Framework for Aboriginal and Torres Strait Islander Communities in Australia, Developed during COVID-19 (67)</p>	<p>Developed culturally responsive trauma-informed public health emergency response framework</p>	<p>To develop a culturally responsive trauma-informed public health emergency response framework for Aboriginal and Torres Strait Islander people</p>	<p>The framework included: an overarching philosophy (cultural humility, safety and responsiveness); key enablers (local leadership and Eldership); supporting strategies (provision of basic needs and resources, well-functioning social systems, human rights, dignity, choice, justice and ethics, mutuality and collective responsibility, and strengthening of existing systems); interdependent core concepts (safety, transparency, and empowerment, holistic support, connectedness and collaboration, and compassion, protection and caring); and central goals (a sense of security, resilience, wellbeing, self- and collective-efficacy,</p>	<p>Health outcomes</p> <ul style="list-style-type: none"> <li>• General health and well-being: Well-being</li> </ul>

			hope, trust, resilience, and healing from grief and loss).	
Modelling the health impacts of disruptions to essential health services during COVID-19 Module 1: Understanding modelling approaches for sexual, reproductive, maternal, newborn, child and adolescent health, and nutrition (84)	Proposed framework	The Framework aims to assess the performance and progress of the country and regional responses against the country's national plans/responses, and the WHO COVID-19 Strategic Preparedness and Response Plan.	To address the continued need to use models for country planning and policy development, a new tool – the benefit–risk model for maintaining essential reproductive, maternal, newborn, child and adolescent health services in the COVID-19 pandemic – is under development by WHO to help countries to prioritize and implement strategies to maintain essential services. This model combines the LiST models and the benefit–risk assessment models of the London School of Hygiene & Tropical Medicine. LiST is used to estimate the lives saved at different levels of service provision. The combination of these two models allows the trade-offs (between the risk of lives lost to COVID-19 and lives saved by mother and child health interventions) to be estimated when trying to maintain immunization coverage and other health services provided at health facilities. Most models of the effects of COVID-19 on maternal, newborn, child and adolescent health rely on Spectrum and LiST. Key assumptions in LiST – such as distributions in the cause of death in individual countries, the affected fraction (proportion of the population affected by a given disease or ailment) and the effectiveness of the interventions – are very important.	2. Impaired healthcare for non-COVID-19 conditions (Access) <ul style="list-style-type: none"> <li>Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)</li> </ul> Health outcomes <ul style="list-style-type: none"> <li>Morbidity: Occurrence of (vaccine-preventable) infectious diseases</li> <li>Morbidity: Occurrence of (vaccine-preventable) infectious diseases</li> </ul>

## Land Acknowledgement(s)

SPOR Evidence Alliance operates from the St. Michael's Hospital, Unity Health Toronto which is located on the traditional land of the Huron-Wendat, the Seneca, and the Mississaugas of the Credit. Today, this meeting place is still the home to many Indigenous people from across Turtle Island.

COVID-END is housed within McMaster University which is located on the traditional territories of the Mississauga and Haudenosaunee nations, and within the lands protected by the "Dish With One Spoon" wampum, an agreement to peaceably share and care for the resources around the Great Lakes.

We are grateful to have the opportunity to work on these lands.

## Funding Acknowledgement(s)

The SPOR Evidence Alliance ([SPOR EA](#)) is supported by the Canadian Institutes of Health Research ([CIHR](#)) under the Strategy for Patient-Oriented Research ([SPOR](#)) initiative.

To help Canadian decision-makers as they respond to unprecedented challenges related to the COVID-19 pandemic, COVID-END in Canada is preparing rapid evidence responses like this one. This rapid synthesis has been funded by the Public Health Agency of Canada. The opinions, results, and conclusions are those of the team that prepared the evidence synthesis and are independent of the Government of Canada and the Public Health Agency of Canada. No endorsement by the Government of Canada or the Public Health Agency of Canada is intended or should be inferred.

## General Disclaimer

This report was prepared by the Unit of Evidence and Deliberation for Decision Making (UNED), University of Antioquia, on behalf of the SPOR Evidence Alliance and COVID-END. It was developed through the analysis, interpretation and synthesis of scientific research and/or health technology assessments published in peer-reviewed journals, institutional websites and other distribution channels. It also incorporates selected information provided by experts and patient/citizen partners with lived experience on the subject matter. This document may not fully reflect all the scientific evidence available at the time this report was prepared. Other relevant scientific findings may have been reported since the completion of this synthesis report.

SPOR Evidence Alliance, COVID-END and the project team make no warranty, express or implied, nor assume any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, data, product, or process disclosed in this report. Conclusions drawn from, or actions undertaken on the basis of, information included in this report are the sole responsibility of the user.

UMD Global CTIS	University of Maryland Social Data Science Center Global COVID-19 Trends and Impact Survey
UN	United Nations
USD	United States Dollar
VPD	Vaccine preventable diseases
WASH	Water sanitation and hygiene
WB	World Bank
WHO	World Health Organization

\*Spanish abbreviation

## Key Definitions

**FFP2/3:** It is a type of face mask with Protection class FFP2. Are made for working environments in which deleterious and mutagenic particles can be found in the breathing air.

**Generalized anxiety disorder (GAD-7):** Seven item self-report Items include statements such as “Feeling anxious, nervous or on edge” rated for intensity of occurrence over the last two weeks from 0 to 3 respectively for the following options: not at all, several days, over half the days, or nearly every day. A cutoff value of  $\geq 5$  was used as indication of mild to moderate anxiety and a value of  $> 15$  indicated severe anxiety.

**Gratitude Questionnaire (GQ-6):** Gratitude Questionnaire [GQ-6] is a six-item self-report measure designed to quantify individual variances in the proneness to experience gratitude in daily life. Items are rated on a seven-point Likert-type scale, where 1 = strongly disagree and 7 = strongly agree.

**Impact of Event Scale (IES-22):** 22-item scale used to evaluate the degree of distress one experiences in response to a given trauma. Items include statements such as “any reminder brought back feelings about it”, “I had trouble concentrating” and “I tried not to talk about it”. Items are rated for distressing levels over the last seven days on a scale from 0 [not at all] to 4 [extremely]. A cutoff value of  $> 24$  was used as indication of clinical worry and a value of  $> 33$  indicated likely PTSD diagnosis.

**Indicator:** A construct of public health surveillance that defines a measure of health.

**IRIS:** It refers to the Pan American Health Organization database.

**Out-of-pocket:** Expenses for medical care that aren't reimbursed by insurance.

**Patient Health Questionnaire (PHQ-9):** Nine item self-report measure to monitor the presence and severity of depression symptoms. Items include statements such as “Feeling down, depressed or helpless” and “Little pleasure or interest in doing things” rated for intensity of occurrence over the last two weeks from 0 to 3 respectively for the following options: not at all, several days, more than half the days, or nearly every day. A cutoff value of  $\geq 5$  was used as indication of mild to moderate depression and a value of  $> 20$  indicated severe depression.

**Pittsburgh Sleep Quality Index (PSQI):** 18 items on a four-point Likert scale, and is designed to measure sleep disturbances and sleep habits over a one-month period. It includes questions about time of bed, the number of hours of sleep per night, wake up time, and the time it takes to fall asleep. It also includes statements such as “during the past month how often have you had trouble sleeping because you have bad dreams” and “how would you rate your overall quality of sleep”. Each statement is scored between 0 [not during the past month] and 3 [three or more times a week]. Statements are broken down into seven components and converted to a point score. Higher scores indicate poorer sleep hygiene and scores  $> 5$  point to poor sleep quality. Validity and reliability have been previously reported.

### Appendix 3. Included studies.

Systematic Reviews					
Article	Country	Population	Year of literature search	Scope	Main findings
Tran et al., 2022 (9)	Global and national levels	Global population	2021	This study aimed to summarize measurement profiles of existing risk assessment toolkits to inform COVID-19 control at global and national levels.	Direct effects of disasters <ul style="list-style-type: none"> <li>Preparedness and responses to infectious disease epidemics and pandemics</li> </ul>
Henssler et al., 2022 (15)	Global	Persons in quarantine or isolation that had a quantitative assessment of psychological outcome parameters.	2020	Systematic literature review and meta-analysis assessing the psychological effects in both quarantined and isolated persons compared to non-quarantined and non-isolated persons.	Direct effects of containment measures <ul style="list-style-type: none"> <li>Mental health</li> </ul>
Jiang et al., 2022 (13)	Australia		2021	Summarize the impact of restrictive lockdown measures on the general mental health of people living in Victoria, Australia during 2020 and to identify the groups with an increased risk of adverse mental health outcomes	Impaired healthcare for non-COVID-19 conditions (Access) <ul style="list-style-type: none"> <li>Telemedicine consults</li> </ul> Direct effects of containment measures <ul style="list-style-type: none"> <li>Psychological distress</li> <li>Time spent outside / time for leisure activities.</li> <li>Work-life balance</li> </ul> Indirect effects of containment measures through risk factors <ul style="list-style-type: none"> <li>Alcohol use</li> <li>Tobacco use</li> </ul> Indirect effects of containment measures through wider

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

					determinants of health • Unemployment
Franco et al., 2022 (19)	Global		2022	Describe the findings of studies assessing key outcomes related to wellbeing and recovery in children and adolescents using the evidence derived from an evidence map	Health outcomes • General health and well-being: Quality of life
Muehlschlegel et al., 2021 (11)	Global	Human populations during different infectious outbreaks (SARS, COVID-19, MERS, Ebola, or H1N1)	2021	Aims to analyze the biopsychosocial consequences after lockdown measures	Direct effects of containment measures • Psychological distress
Shankar et al., 2021 (16)	Global		2021	The review seeks to answer three important questions. The first is to identify the stressors mentioned in published studies during the pandemic till January 15th, 2021. The second objective is to see which subgroups of students may be at greater risk of mental health problems. Recommendations by the authors of the manuscripts included in the review to reduce stress levels and support health science students will also be mentioned (third objective).	Direct effects of containment measures • Psychological distress Health outcomes • General health and well-being: Self-perceived (mental) health
Tong et al., 2023 (7)	Global		2021	(1) What is the overall estimated prevalence of insomnia, stress, anxiety, and depression among frontline HCWs during the COVID-19 pandemic? (2) What are the differences of mental health problems among frontline	Direct effects of containment measures • Psychological distress

				HCWs in different periods and regions during COVID-19?	
Demissie et al., 2021 (14)	Global	Pregnant and/or lactating women	2020	Examine the effects of coronavirus disease 2019 pandemic on the prevalence of anxiety, depression, stress, insomnia, and social dysfunction among pregnant and/or lactating women and to measure the global pooled prevalence of mental health effects among these populations in the era of coronavirus disease 2019 pandemic.	Health outcomes <ul style="list-style-type: none"> <li>• General health and well-being: Self-perceived (mental) health</li> </ul>
McGrath et al., 2021 (6)	High-income countries	Working-age adults (18–64 years) living in high-income, OECD countries experiencing periods of personal or household financial uncertainty relating to employment (e.g., recent or imminent unemployment, precarious employment), personal debt and legal issues, housing security (e.g., mortgage or rent stress,	2019	Examined the effectiveness of community interventions for protecting and promoting the mental health of working-age adults in high-income countries during periods of financial insecurity.	Health outcomes <ul style="list-style-type: none"> <li>• General health and well-being: Self-perceived (mental) health</li> </ul>

		threatened eviction) or food insecurity.			
Al-Ajlouni et al., 2022 (8)	Middle Eastern and North African countries		2022	Systematic review of the literature on the impact of the COVID-19 pandemic on sleep health among Middle Eastern and North African (MENA) populations, understudied geographic regions including with regards to sleep health	Direct effects of containment measures <ul style="list-style-type: none"> <li>• Sleeping alterations</li> <li>• Work-life balance</li> </ul>
Bacanoiu et al., 2022 (17)	Global	patients with neurodegenerative diseases and associated comorbidities, such as Myasthenia and Vascular dementia	2021	The aim of the paper is to carry out a literature analyses regarding how the lockdown and physical activity influence motor and cognitive function, based on evaluation of the impact of decreasing physical activity, and the affected emotional status of healthy adults and patients with neurodegenerative diseases and associated comorbidities, such as Myasthenia and Vascular dementia, in conditions imposed by COVID- 19.	Direct effects of containment measures <ul style="list-style-type: none"> <li>• Psychological distress</li> <li>• Social support</li> </ul> Indirect effects of containment measures through risk factors <ul style="list-style-type: none"> <li>• Diet</li> <li>• Physical activity</li> </ul> Health outcomes <ul style="list-style-type: none"> <li>• General health and well-being: Self-perceived (mental) health</li> <li>• General health and well-being: Sleep</li> <li>• General health and well-being: Well-being</li> <li>• General health and well-being: Quality of life</li> </ul>
Larkin et al., 2022 (10)	United States		2022	Compare results for COVID-19 vaccines with those of prior vaccines	Health outcomes <ul style="list-style-type: none"> <li>• Mortality: Mortality from infectious diseases other than COVID-19</li> </ul>
Fallah-Aliabadi et al., 2022 (20)	United States		2022	Identify and categorize social vulnerability indicators in the COVID-19 pandemic.	Direct effects of containment measures <ul style="list-style-type: none"> <li>• Connectivity</li> </ul> Impaired healthcare for non-COVID-19 conditions (Access) <ul style="list-style-type: none"> <li>• Unmet health care needs</li> <li>• Coverage of health care services for non-COVID-19 conditions (number of consultations, number of</li> </ul>

					<p>interventions)</p> <ul style="list-style-type: none"> <li>• Human resources for health / workload</li> </ul> <p>Indirect effects of containment measures through risk factors</p> <ul style="list-style-type: none"> <li>• Overweight/obesity</li> <li>• Tobacco use</li> <li>• Hypertension</li> <li>• Metabolic conditions</li> <li>• Cardiopulmonary conditions</li> </ul> <p>Indirect effects of containment measures through wider determinants of health</p> <ul style="list-style-type: none"> <li>• Childhood development</li> <li>• Education</li> <li>• Income / (at risk of) poverty</li> <li>• Unemployment</li> <li>• Transport behavior</li> </ul>
Ma et al., 2022 (12)	Global	COVID-19 survivors	2022	Assess the long-term effects of COVID-19 at 6 months and above to provide a more comprehensive and scientific basis for the care and rehabilitation of COVID-19 survivors, the surveillance of these patients, and setting public health policy for healthcare facilities.	<p>Direct effects of containment measures</p> <ul style="list-style-type: none"> <li>• Psychological distress</li> </ul> <p>Health outcomes</p> <ul style="list-style-type: none"> <li>• General health and well-being: Sleep</li> </ul>
Rodríguez-Fernández et al., 2021 (18)	China, Spain, Germany, United Kingdom, Saudi Arabia, Brazil, India, South Korea, Pakistan, Jordan, Italy	General adult population	2021	The main objective of this study was to identify the best available scientific evidence on the impact that home confinement and social distancing, derived from the SARS-CoV-2 pandemic, have had on the mental health of the general population in terms of depression, stress and anxiety	<p>Direct effects of containment measures</p> <ul style="list-style-type: none"> <li>• Psychological distress</li> </ul>

	, Vietnam, Turkey, Bangladesh and the US				
<b>Scoping reviews</b>					
Article	Country	Population	Year of literature search	Scope	Main findings
Lim et al., 2021 (21)	Global	To inform future practice and research by examining the COVID-19 pandemic's impacts on primary care at both service and patient levels, as well as strategies employed to mitigate these impacts.	2020	To inform future practice and research by examining the COVID-19 pandemic's impacts on primary care at both service and patient levels, as well as strategies employed to mitigate these impacts.	<p>Direct effects of containment measures</p> <ul style="list-style-type: none"> <li>● Psychological distress</li> <li>● Loneliness</li> <li>● Interpersonal violence (intimate partner violence, child maltreatment, elderly abuse)</li> </ul> <p>Impaired healthcare for non-COVID-19 conditions (Access)</p> <ul style="list-style-type: none"> <li>● Telemedicine consults</li> <li>● Supply of and demand for (essential) medicines</li> <li>● Staff shortage</li> <li>● Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)</li> </ul> <p>Indirect effects of containment measures through risk factors</p> <ul style="list-style-type: none"> <li>● Illicit drug use</li> </ul> <p>Health outcomes</p> <ul style="list-style-type: none"> <li>● Morbidity: Occurrence of chronic diseases</li> <li>● Morbidity: antimicrobial resistance</li> </ul>
<b>Guidelines</b>					
Organization, year	Audience	Population	Scope	Main findings	

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

WHO, 2022 (23)	Member States	Global		Updates the guidance published on 14 February 2022, provides guidance to World Health Organization (WHO) Member States on the continued implementation and strengthening of surveillance for COVID19 disease and the SARS-CoV-2 virus that causes it and reporting requirements for WHO	Impaired healthcare for non-COVID-19 conditions (Access) <ul style="list-style-type: none"> <li>Human resources for health / workload</li> </ul> Health outcomes <ul style="list-style-type: none"> <li>Mortality: Excess mortality</li> </ul>
WHO, 2022 (22)	Decision makers	Global		This operational guidance aims to guide decision making on when and how to implement and strengthen Early Warning Alert and Response (EWAR) in preparation for and response to emergencies	Health outcomes <ul style="list-style-type: none"> <li>Early warning</li> </ul>
<b>Non systematic reviews</b>					
Article	Country	Population	Year of literature search	Scope	Main findings
Harawa et al., 2022 (31)	United States	COVID-19 surveillance systems to monitor racial/ethnic and other disparities in the pandemic		Discuss the importance of each indicator for quantifying health inequities and highlight challenges and data gaps in existing systems that may hamper the achievement of these goals.	Impaired healthcare for non-COVID-19 conditions (Access) <ul style="list-style-type: none"> <li>Supply of and demand for other critical medical equipment (ventilators, dialysis materials)</li> <li>Other resources</li> </ul>
Ford et al., 2021 (30)	United States	US residents		Authors conducted a detailed assessment of diverse surveillance systems and databases to identify characteristics, constraints and best practices	Health outcomes <ul style="list-style-type: none"> <li>General health and well-being: Well-being</li> </ul>

Bhattacharjee et al., 2020 (26)	United States	General population		In this article, the authors critically examine the onset of the pandemic in the United States of America focusing on its effect on the mental health of American people. The authors discuss various strategies to overcome the mental health challenges associated with both the outbreak and response.	Direct effects of containment measures <ul style="list-style-type: none"> <li>• Mental illness</li> </ul>
Chandran et al., 2021 (25)	Malaysia	Non-Communicable Disease surveillance tools, activities and performance in Malaysia	2020	Policy and program documents relating to NCD surveillance in Malaysia from 2010 to 2020 were identified and analyzed. The findings of this review are presented according to the three major themes of the Global Monitoring Framework: monitoring of exposure/risk factor, monitoring of outcomes and health system capacity/response.	Impaired healthcare for non-COVID-19 conditions (Access) <ul style="list-style-type: none"> <li>• Supply of and demand for (essential) medicines</li> <li>• Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)</li> </ul> Indirect effects of containment measures through risk factors <ul style="list-style-type: none"> <li>• Alcohol use</li> <li>• Tobacco use</li> <li>• Alcohol use</li> <li>• Physical activity</li> <li>• Overweight/obesity</li> <li>• Hypertension</li> <li>• High cholesterol</li> <li>• Diet</li> <li>• Illicit drug use</li> </ul> Health outcomes <ul style="list-style-type: none"> <li>• Mortality: Mortality from chronic diseases</li> </ul>
Lim et al., 2022 (28)	South Korea	South Korea		Describe how the South Korean government approached the COVID-19 pandemic by transforming the healthcare system according to the WHO Health Systems Framework. Also focus on how private sectors and the central government actively cooperated to manage the COVID-19 pandemic.	Direct effects of containment measures <ul style="list-style-type: none"> <li>• Psychological distress</li> </ul> Indirect effects of containment measures through risk factors <ul style="list-style-type: none"> <li>• Diet</li> <li>• Metabolic syndrome</li> </ul>
Ahmad et al., 2021 (29)	United States	United States		This report describes the processes that NCHS took to produce timely mortality data in response to the COVID-19 pandemic	Health outcomes <ul style="list-style-type: none"> <li>• Mortality: All-cause mortality</li> <li>• Mortality: Excess mortality</li> </ul>

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

Thorpe et al., 2022 (24)	United States	United States	2020	Summarize data sources with potential to produce timely and spatially granular measures of physical, economic, and social conditions relevant to public health surveillance, and we briefly describe emerging analytic methods to improve small-area estimation	Impaired healthcare for non-COVID-19 conditions (Access) <ul style="list-style-type: none"> <li>Healthcare services usages</li> </ul> Impaired healthcare for non-COVID-19 conditions (financial protection) <ul style="list-style-type: none"> <li>Personal spending</li> </ul> Indirect effects of containment measures through risk factors <ul style="list-style-type: none"> <li>Alcohol use</li> <li>Illicit drug use</li> </ul> Indirect effects of containment measures through wider determinants of health <ul style="list-style-type: none"> <li>Environmental variables</li> <li>Unemployment Income / (at risk of) poverty</li> <li>Childhood development</li> <li>Education</li> <li>Air quality</li> </ul>
Jackson Preston et al., 2022 (27)	United States	Health care workers		The purpose of this Viewpoint is to examine contributors to stress and burnout and highlight existing efforts to address these issues in the US	Impaired healthcare for non-COVID-19 conditions (Access) <ul style="list-style-type: none"> <li>Stress / well-being among health care staff</li> </ul> Health outcomes <ul style="list-style-type: none"> <li>General health and well-being: Well-being</li> </ul>
<b>Primary Studies</b>					
Article	Country	Population	Design	Scope	Main findings
OECD, 2023 (33)	OECD and EU countries	OECD and non-OECD EU country Experts who provided information to the OECD survey from 21 EU member countries responded.	Descriptive	The OECD undertook a pilot study in EU Member States that aimed to determine the utility and feasibility of routine, cross-national monitoring of access to medicines across multiple dimensions. The work included a desk review to define the dimensions of access and associated indicators, followed by an OECD survey to explore the feasibility of collecting and analyzing the relevant data for a convenience sample of 15 recently authorized	Impaired healthcare for non-COVID-19 conditions (Access) <ul style="list-style-type: none"> <li>Supply of and demand for (essential) medicines</li> </ul> Impaired healthcare for non-COVID-19 conditions (financial protection) <ul style="list-style-type: none"> <li>Out-of-pocket payments</li> </ul>

				product/indication pairs. Using the convenience sample of 15 novel medicine and treatment indication pairs (i.e., products/indications) representing different medicine archetypes and therapeutic areas, retrospective data from 21 countries were collected via an OECD survey covering different aspects of access relative to the lifecycle of each sample medicine. Several indicators were generated reflecting the dimensions of availability, affordability, accessibility, and acceptability	
Osewe, 2021 (34)	Republic of Korea, Thailand, and Viet Nam	ROK, Thailand, and Viet Nam.	Case studies	Share experiences in addressing COVID-19 across three distinct countries: the ROK, Thailand, and Viet Nam. Also presents indicators used by the author to reflect Thailand Context and Health System context	<p>Impaired healthcare for non-COVID-19 conditions (Access)</p> <ul style="list-style-type: none"> <li>• Human resources for health / workload</li> <li>• Other resources</li> </ul> <p>Impaired healthcare for non-COVID-19 conditions (financial protection)</p> <ul style="list-style-type: none"> <li>• Public spending on health (by function, provision, illness)</li> <li>• Out-of-pocket payments</li> </ul> <p>Health outcomes</p> <ul style="list-style-type: none"> <li>• Mortality: Maternal mortality</li> <li>• Mortality: Mortality from chronic diseases</li> <li>• Mortality: Fatal injuries (including suicide)</li> </ul>
Maya et al., 2022 (35)	United States	Adult population	Developing of a cost-effectiveness framework	Development of a cost-effectiveness framework to evaluate societal costs and quality adjusted life years (QALYs) lost due to six health-related indirect effects of COVID-19 in California. Short- and long-term outcomes were evaluated for the adult population	<p>Quality-Adjusted Life Years (QALYs) Lost</p> <ul style="list-style-type: none"> <li>• Societal costs and quality adjusted life years (QALYs) lost</li> </ul>
Ferraro et al., 2021 (36)	England	England population	Descriptive	This study describes the indirect impact of COVID-19 on healthcare utilization using a range of syndromic indicators including eye conditions, mumps, fractures, herpes zoster	Impaired healthcare for non-COVID-19 conditions (Access)

				and cardiac conditions. Data from the syndromic surveillance systems monitored by Public Health England were used to describe the number of contacts with NHS 111, general practitioner (GP) In Hours (GPIH) and Out-of-Hours (GPOOH), Ambulance and Emergency Department (ED) services over comparable periods before and during the pandemic.	<ul style="list-style-type: none"> <li>• Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)</li> </ul> <p>Direct effects of containment measures</p> <ul style="list-style-type: none"> <li>• Health care utilization</li> <li>• Healthcare seeking behavior.</li> </ul>
Bright et al., 2020 (37)	Australia	Australia population	Descriptive	Analyzed Nationally Notifiable Diseases Surveillance System (NNDSS) data to determine the effect of COVID-19 public health measures on other nationally notifiable diseases in Australia.	<p>Impaired healthcare for non-COVID-19 conditions (Access)</p> <ul style="list-style-type: none"> <li>• Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)</li> </ul>
Flor et al., 2022 (38)	Global	General COVID-19 population	Cohort	Explore gender disparities in major health-related and non-health-related indicators at the regional and global level. Review and synthesize publicly-available datasets that describe the impact of the social and economic fallout of the COVID-19 pandemic on gender equality in health and other core domains of wellbeing worldwide.	<p>Impaired healthcare for non-COVID-19 conditions (Access)</p> <ul style="list-style-type: none"> <li>• Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)</li> <li>• Supply of and demand for (essential) medicines</li> <li>• Supply of and demand for other medical equipment</li> </ul> <p>Direct effects of containment measures</p> <ul style="list-style-type: none"> <li>• Time spent on unpaid domestic and care work.</li> <li>• Interpersonal violence (intimate partner violence, child maltreatment, elderly abuse)</li> </ul> <p>Indirect effects of containment measures through wider determinants of health</p> <ul style="list-style-type: none"> <li>• Unemployment</li> <li>• Income / (at risk of) poverty</li> <li>• Education</li> </ul>
Brakefield et al., 2021 (32)	United States	General population	Design and Development Study	This study sought to redefine the Healthy People 2030's SDoH taxonomy to accommodate the COVID-19 pandemic and provide a blueprint and implement a prototype for the Urban Population Health Observatory (UPHO), a web-based platform that integrates	<p>Impaired healthcare for non-COVID-19 conditions (Access)</p> <ul style="list-style-type: none"> <li>• Unmet health care needs</li> <li>• Human resources for health / workload</li> <li>• Access</li> </ul> <p>Direct effects of containment measures</p> <ul style="list-style-type: none"> <li>• Connectivity</li> </ul>

				<p>classified group-level SDoH indicators to individual- and aggregate-level population health data.</p> <p>SDoH: Social Determinants of Health.</p> <p>Modified Healthy People 2030's SDoH taxonomy include and classify SDoH indicators reported previously into the following six domains: (1) SDoH that affect access to resources; (2) SDoH that increase disease exposure, susceptibility, and severity; (3) SDoH that affect adherence to local laws and health policies; (4) SDoH that are community characteristics; (5) SDoH that help increase awareness, knowledge dissemination, and health education; and (6) SDoH specific to neighborhood and built environment that can impact COVID-19-associated comorbidities</p>	<ul style="list-style-type: none"> <li>• Work-life balance</li> </ul> <p>Indirect effects of containment measures through risk factors</p> <ul style="list-style-type: none"> <li>• Tobacco use</li> <li>• Diet</li> </ul> <p>Indirect effects of containment measures through wider determinants of health</p> <ul style="list-style-type: none"> <li>• Transport behavior</li> <li>• Income / (at risk of) poverty</li> <li>• Unemployment</li> <li>• Criminality</li> <li>• Air quality</li> </ul>
BinDhim et al., 2021 (39)	Saudi Arabia	Arabic-speaking Saudi residents who were ≥18 years old of the 13 administrative region	Descriptive	To explore the prevalence of some behavioral health risk factors, intermediate risk factors, and chronic diseases at different timepoints during 2020 using the data available from a currently used surveillance system in Saudi Arabia.	<p>Indirect effects of containment measures through risk factors</p> <ul style="list-style-type: none"> <li>• Physical activity</li> <li>• Diet</li> <li>• Overweight/obesity</li> <li>• Hypertension</li> <li>• Tobacco use</li> <li>• High cholesterol</li> <li>• Waterpipe Smoking</li> <li>• E-Cigarette Smoking</li> </ul> <p>Health outcomes</p> <ul style="list-style-type: none"> <li>• Morbidity: Occurrence of chronic diseases</li> </ul>
Bello et al., 2021 (40)	East and Southern African countries	General population from 19 countries in the East and	Cross sectional	The authors reviewed the integrated supportive supervision (ISS) data and the routine administrative coverage from 19 countries in the East and Southern Africa (ESA) for the period January to August 2019 to analyze the trends in the number of visits,	<p>Impaired healthcare for non-COVID-19 conditions (Access)</p> <ul style="list-style-type: none"> <li>• Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)</li> <li>• Unmet health care needs</li> </ul>

		Southern Africa (ESA)		vaccine-preventable diseases (VPD), and routine immunization (RI) indicators, and compare with the period January to August 2020 during the months of the COVID-19 pandemic	
El Khoury-Malhame et al., 2023 (41)	Lebanon	348 Lebanese adults	Cross sectional	Investigates the psychological impact of the viral spread and austere lockdown and focuses mostly on potential protective factors in a politically and economically unstable society. Participants filled questionnaires of perceived stress (PSS), depression (PHQ-9), anxiety (GAD-7), PTSD (IES-22), as well as sleep (PSQi) and gratitude (GQ-6) immediately after 3 months of strict quarantine	Direct effects of containment measures <ul style="list-style-type: none"> <li>Psychological distress</li> </ul>
Stoto et al., 2021 (42)	Global	General	Descriptive	A new report from the National Academies of Sciences, Engineering, and Medicine proposes a uniform national framework for data collection to more accurately quantify disaster related deaths, injuries, and illnesses. This article describes how following the report's recommendations could help improve the quality and timeliness of public health surveillance data during pandemics, with special attention to addressing gaps in the data necessary to understand pandemic-related health disparities.	Health outcomes <ul style="list-style-type: none"> <li>Mortality: Excess mortality</li> </ul>
Moser et al., 2020 (43)	Switzerland	Random sample of a large cohort of the resident population in Switzerland	Cohort	Provide almost real-time evidence about relevant social and health behavior indicators, to inform the public and health authorities about the impact of the COVID-19 pandemic on relevant social and public health domains.	Impaired healthcare for non-COVID-19 conditions (Access) <ul style="list-style-type: none"> <li>Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)</li> </ul> Direct effects of containment measures <ul style="list-style-type: none"> <li>Psychological distress</li> </ul>

**Organization reports**

Organization, year	Target audience	Country	Scope	Main findings
ECDC, 2020 (70)	The target audience is public health authorities in EU/EEA countries and the UK involved in planning response activities to the COVID-19 pandemic.	European Union (EU), European Economic Area (EEA) countries and the United Kingdom (UK)	Provide a set of standardized indicators to guide subnational, national and EU level response to COVID-19 in the EU/EEA and the UK. The framework presents indicators for a variety of key pillars of COVID-19 preparedness, prevention and control activities and provides guidance to countries on how to collect and analyze data for the suggested indicators. Pillars: Pillar 1: Country-level coordination, planning, and monitoring Pillar 2: Risk communication and community engagement Pillar 3: Surveillance, rapid response teams and case investigation Pillar 4: Vaccine monitoring (policy, coverage, safety, effectiveness and acceptance)	Impaired healthcare for non-COVID-19 conditions (quality) <ul style="list-style-type: none"> <li>● Adherence to medical guidelines</li> <li>● Health care quality in various settings (for example, primary care, hospital care, acute care)</li> </ul> Impaired healthcare for non-COVID-19 conditions (Access) <ul style="list-style-type: none"> <li>● Supply of and demand for PPE</li> <li>● Health care services</li> <li>● Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)</li> </ul> Direct effects of containment measures <ul style="list-style-type: none"> <li>● Loneliness</li> <li>● Social support</li> <li>● Adherence to containment measures such as hygiene and physical distancing measures</li> </ul>

Public health surveillance programs, systems, and strategies to monitor the indirect population health impact attributable to the COVID-19 pandemic and the associated public health response measures: A Rapid Scoping Review.

			<p>Pillar 5: Testing policy and practice (WHO pillar 'national laboratories')</p> <p>Pillar 6: Infection prevention and control</p> <p>Pillar 7: Case management</p> <p>Pillar 8: Maintaining essential health services and systems</p>	<p>Indirect effects of containment measures through wider determinants of health</p> <ul style="list-style-type: none"> <li>• Transport behavior</li> <li>• Movement restrictions</li> <li>• Education</li> <li>• Work behavior</li> </ul> <p>Health outcomes</p> <ul style="list-style-type: none"> <li>• Mortality: Excess mortality</li> <li>• Morbidity: Occurrence of (vaccine-preventable) infectious diseases</li> </ul>
ECLAC and PAHO, 2021 (71)	Latin America and Caribbean countries	Latin America and Caribbean countries	<p>This report highlights the need to strengthen coordination, regional integration and international cooperation mechanisms. It also underscores the need for a transformation of health systems based on primary health care, with universal health as the guiding principle. It calls for the strengthening of health authorities' institutional capacities, forging a resilient health system that is capable of responding to current and future challenges. The report presents indicators used to show the evolution of the pandemic and its implications for health, society and the economy.</p>	<p>Impaired healthcare for non-COVID-19 conditions (financial protection)</p> <ul style="list-style-type: none"> <li>• Public spending on health (by function, provision, illness)</li> </ul>
ECLAC and UNDRR, 2021 (72)	The insular Caribbean.	The insular Caribbean.	<p>To provide an overview of how the Caribbean is addressing the pandemic, notably in terms of its economies and disaster risk reduction governance mechanisms. Presents results from selected indicators of the Global Health Security Index that measures national capacities to prevent, detect, and respond to public health emergencies</p>	<p>Impaired healthcare for non-COVID-19 conditions (Access)</p> <ul style="list-style-type: none"> <li>• Human resources for health / workload</li> <li>• Other resources</li> <li>• Coverage of health care services for non-COVID-19 conditions (number of consultations, number of interventions)</li> </ul> <p>Impaired healthcare for non-COVID-19 conditions (financial protection)</p> <ul style="list-style-type: none"> <li>• Public spending on health (by function, provision, illness)</li> <li>• Out-of-pocket payments</li> </ul> <p>Indirect effects of containment measures through wider determinants of health</p> <ul style="list-style-type: none"> <li>• Essential services</li> </ul>

OECD, 2022 (73)	OECD countries	OECD countries	Provides evidence on the impact of the pandemic on immigrant integration in terms of health, labor market outcomes and training, as OECD countries start to recover from the crisis.	Indirect effects of containment measures through wider determinants of health <ul style="list-style-type: none"> <li>• Education</li> </ul>
ECDC, 2022 (74)		Europe	To capitalize on this experience to identify specific challenges that were encountered, as well as successful responses to them	Impaired healthcare for non-COVID-19 conditions (Access) <ul style="list-style-type: none"> <li>• Supply of and demand for PPE</li> <li>• Human resources for health / workload</li> </ul>
OECD, 2020 (75)		Latin America	Updates indicators and the main socio-economic consequences of the COVID-19 crisis in Latin America and the Caribbean (LAC) and presents the main policy priorities to be achieved, taking into account the most recent evolution of the crisis	Direct effects of containment measures <ul style="list-style-type: none"> <li>• Interpersonal violence (intimate partner violence, child maltreatment, elderly abuse)</li> <li>• Psychological distress</li> </ul> Indirect effects of containment measures through wider determinants of health <ul style="list-style-type: none"> <li>• Income / (at risk of) poverty</li> <li>• Unemployment</li> <li>• Digital technologies usage</li> <li>• Education</li> <li>• Workers on flexible contracts / informal workers</li> <li>• Public spending on essential services</li> </ul>
ECDC, 2022 (76)	Europe	Europe	This document outlines operational considerations to support the continuity of national surveillance systems and public health laboratories for epidemiological and virological surveillance for influenza, SARS-CoV-2, and potentially other respiratory viruses (such as RSV or new viruses of public health concern) in the 2022/2023 winter season and beyond	Impaired healthcare for non-COVID-19 conditions (quality) <ul style="list-style-type: none"> <li>• Health care quality in various settings (for example, primary care, hospital care, acute care)</li> </ul> Health outcomes <ul style="list-style-type: none"> <li>• Mortality: Excess mortality</li> </ul> Environmental indicators <ul style="list-style-type: none"> <li>• Wastewater</li> </ul>
ECLAC and ILO, 2022 (77)		Latin America and the Caribbean	The first section of this report describes, the pace of job creation is expected to slow in 2022, although progress with vaccinations, fewer movement restrictions and reopening of schools are expected to drive a recovery in participation, especially among women. However, the combined effect of higher labor force participation rates and slow job creation could drive the unemployment rate up over the year.	Indirect effects of containment measures through wider determinants of health <ul style="list-style-type: none"> <li>• Income / (at risk of) poverty</li> <li>• Unemployment</li> <li>• Workers on flexible contracts / informal workers</li> </ul>

			The second section of the report outlines how the health crisis caused by COVID-19 has severely affected wage trends in the region.	
ECLAC, 2022 (78)		Latin America and the Caribbean	This Special Report is the thirteenth in a series prepared by the Economic Commission for Latin America and the Caribbean (ECLAC) on the evolution and impacts of the COVID-19 pandemic in Latin America and the Caribbean.	Indirect effects of containment measures through wider determinants of health <ul style="list-style-type: none"> <li>Income / (at risk of) poverty</li> <li>Workers on flexible contracts / informal workers</li> <li>Environmental effects</li> </ul>
